There are no embarrassing questions. We all had to start somewhere.

Firstly. is DOS loaded???
To load dos, turn on drive, instert the disk, close door then turn on
the computer.
you should hear a series of beeps comming from the speaker thenthe
ready prompt.
Anything else like errors or no loading at all means something is not
working.

From basic, enter DOS for the dos menu.

From dos, B to enter cartridge (basic).
From basic LOAD"D:program.ext. where program.ext is the name of the
program you wish to load.
SAVE"D:program.ext saves your program.
LIST"D:program.ext Lists the program to disk.
ENTER"D:program.ext Enters a listed program from disk.

The last two instructions do have a use but are not mandtory.
They are used to clear out the vairable table of unused vairables
because Atari basic can only have 128 vairables.

CLOAD and CSAVE are used for the 410 only.

James.

BTW... I have no Atari DOS loaded on here... just the pre-loaded BASIC and I
also have the Atari Assembler Editor cart. I have no way of knowing the
filenames on the one floppy disk I have.

There are demos of most of them on any Atari ftp site. A Falcon or TT
is a modest machine admittedly for rendering (16/32MHz 68030 isn't too
fast in todays world), but run POV-ray on a Hades060 and stuff that will
take 24 hours on a TT will take about 9 minutes on a Hades. And yes there
are Hades machines out there...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Very true. I was an Atari computer user for, gosh, at least a decade, my last machines being a Falcon and a TT. I loved Atari machines but am now using an iMac at home but only because I work for an Internet company that is all-Mac (have a new G3 at work :-)). Anyway, my point is that MagiC made Apple's OS look abysmal in the area of multitasking. The next Mac update (8.6) is supposed to begin to address this but I'll keep you posted :-).

Scott

Hi Scott. Good point. Do keep us updated-its always best to know your
opponents... ;-)

BTW, what you said about MagiC vs current Mac multitasking? Ditto for
TOS machines using MiNT... ;-)

Catch ya later..

That would explain why ST Informer has not been updated in months...  How
about iMac Informer?

By JOSEPH MENN

(April 25, 1999 9:09 a.m. EDT http://www.nandotimes.com) - Guy Kawasaki, the unorthodox former "chief evangelist" of Apple Computer, is closing up shop, satisfied he's no longer needed.

Even after he launched Garage.com, which matches start-ups with venture capitalists, Kawasaki had continued to flog the misinformed in the press and the public and to tout the virtues of all things Apple through his EvangeList newsletter and Web site.

Last week, he told about 40,000 of the faithful that his services were no longer needed.

"In the past two years, Apple has experienced a stunning turnaround. This is due to many things, including the steadfast loyalty of Apple's customers - and EvangeListas are the most steadfast of the steadfast," Kawasaki wrote.

"The original purpose of EvangeList was to counteract the negative news about Apple and Macintosh, and I believe that EvangeList has served its purpose - fantastically, as a matter of fact. So after discussing what we should do with EvangeList with the folks at Apple, we've decided to retire the List."

Rhona Hamilton, an Apple spokeswoman, agreed that the newsletter "really served its purpose." Now the company has its own electronic news bulletins, and many Web sites are devoted to the Mac and other products.

"We think everyone will be taken care of," she said.

1) the Atari and Amiga "Jihads" are only a figment of your fevered paranoid imagination.

2) as far as you being "well-rounded and informed" - well, seeing as you've been caught making up stuff about Ataris out of whole cloth, or using info from rags like the Daily Tubby to bolster your SJR-DF� claims, and it looks like you're about to do the same with Amiga, we all know how suspect you really are.

<snip>

too bad Guy Kawasaki hung up his pom-poms, as Apple was hit with two bits of bad news this week....

1) Best Buy dropped the iMac completely from their stores, citing Apple's inflexibility in supplying them with the proper proportion of colours, and mentioning that they were fearful that they wouldn't sell. This of course meand that Apple now has only one national distributor...

2) Avid - a major player in the video-editing field - announced that the latest version of their Mac video software would be its last, and that all new development would now be focussed on Windows NT. Needless to say, Mac users are really ticked off....

>--
>Peter S.
>PowerBook G3/266....14'', 64MB, 4G's, ethernet, 56k, S-Video out....

which of course, is overstocked at the warehouse, and even cutting the price down to fire sale levels aren't getting them moving....

>Buy AAPL Stock...

why, when the movement of value of Apple shares is going DOWN? Seems Wall Street isn't affected by the Reality-Distortion Field� either. Is TiFKAS shilling the stocks because he knows that, if Apple's value doesn't go up, Steve Jobs will start another round of job cuts, starting with HIM?

"Every story you've ever heard about Steve (Jobs) is true. Working for him was the greatest experience of my life that I wouldn't want to repeat" - Guy Kawasaki

Hello???. You said...

> > > But how do you really know when there is no apps to try out this
multi-
> > > tasking...? Hack and slash poor apps are not real world tests..-)

Since when do you need "new software" or "updates" to try out "this"
multitasking?.

"Real" mulitasking works whether you're using old or new apps, and if
you're suggesting that the Amiga doesn't make full use of multitasking for
the apps that are out there you must be on drugs.

Ofcourse, Amiga (and Atari now too as I understand, although not from
personal experience) have a "real" multitasking desktop OS, unlike Apple.

You can have all the apps in the world, but can *you* try out pre-emptive
multithreaded multitasking on your current OS?.

Can't you at least admit that Atari is deader then Amiga ? :-)

Regards,

Clockmeister.

Some would say that an '060 machine is pretty modest as well, in the real world.

Subject: Whats the best OS?

Answer: Anything by Microsoft.

It never crashes, uses little RAM and disc space, and runs very fast.

Bill Gates told me - and he wouldn't lie to me, would he?

Does this mean they have it working and that I can use Wordsworth on a 2 meg A1200 and produce a quarter of an A4 page with an image WITHOUT it crashing....

Any one of my HALF meg ST's can do that, in single tasking!

>
>Ofcourse, Amiga (and Atari now too as I understand, although not from
>personal experience) have a "real" multitasking desktop OS, unlike Apple.

The Atari has had multitasking software for a long time, what's the Amiga's excuse!

>

>Can't you at least admit that Atari is deader then Amiga ? :-)

Walk into ANY decent music studio around the world, and how many will have an Amiga in!!!! Not many.... It still doesn't come with a MIDI as standard, I'll spell it for you; musical instrument digital interface.

Many musicians are using their ST's for their music. This is due to the useless midi that the PC tries to imitate.

Now the Amiga is alright for repetitive House & ACID type of noise that you need drugs to find entertaining; you know the sort of 'so called' music they have on 'Trainspotting' TV program; sounds great when your totally pissed;) Hey my kids can do it well... chopsticks using a synth, sorry Amiga couldn't cope with that either.

Curious, when was the last time YOU saw an Amiga in a film, publication, or documentary!!!!!! Hey if it wasn't for Atari the Amiga wouldn't exist! I wonder why Atari turned the project down when they commissioned it!

There's another thing that Atarian's are good at, we support our third party software producers and prefer ORIGINAL software. Why is it that the Amiga user prefers to pay �2 (GBP) per DISK for PIRATED software, rather than pay �2 (GBP) for the real thing and some of the programs had 2/3 disks!!!!!

I had nearly 100 ORIGINAL software packages, ALL popular titles. I gave up trying to sell than as when I mentioned that these are originals people weren't interested!!! I gave them my nephew to take to school and give any of his friends that have Amoeba's. This is not fiction, but FACT.

Please be patient with me. I know we don't have this all in order, but we are trying....If this is the wrong newsgroup for posting this message, please don't flame me to badly....

I work for a non-profit organization, Help Eliminate Marijuana Prohibition (H.E.M.P.), making an educational CD-ROM (called the "Electric Emperor") on the uses of hemp (medicine, food, fuel, fiber, building materials, plastics, oils, etc.) and the history of marijuana prohibition.

The first version of the CD-ROM was Macintosh only. The second version was Macintosh and Windows 95. The third (and most recent) version is an attempt at true cross-platform, reaching Amiga, BeOS, OS/2, plus LINUX, FreeBSD, OpenBSD, NetBSD, and all the various other flavors of UNIX (free or commercial). Or at least, that is the goal.

To be perfectly honest, we're really not sure how well we did this (all our work is done on old 68000, 68020, 68030, and 68040 Macintoshes). We have made a limited press run of 1,000 disks for working out the bugs and are offering these disks to brave souls willing to test them out and find out what goes wrong (we're certain there will be things that go wrong) and help us document what is needed to get the multi-media presentation running cross-platform.

The third edition of the Electric Emperor has the following items (still to be determined how much is playable on various platforms):

(1) The complete 1942 USDA film "Hemp For Victory" in QuickTime movie format with CinePak CODEC.

(2) The complete text (11th edition) and pictures (samples from all 11 editions, many colorized) from Jack Herer's "The Emperor Wears No Clothes: The Authoritative Historical Record of Cannabis and the Conspiracy Against Marijuana and How Hemp Can Save the World!", the number one best selling book on hemp. The text is presented in a series of plain 7-bit ASCII text files and in HTML 4 (with pictures and other multimedia).

The HTML presentation is the heart of the cross-platform multi-media presentation. With Netscape's browser and Adobe's PDF players being near universal, MacroMedia's ShockWave spreading across platforms, and widespread availability of third-party QuickTime players, it should be possible to present this education information in an interesting manner regardless of platform. Notice the word "should." An important part of this experiment is finding out what really works cross-platform and what needs to be tweaked.

(3) Three music videos on hemp in QuickTime movie format with CinePak CODEC. These are "Intro" (a brief overview of the uses of hemp), Michael M's "Hemp Hemp Hooray" (medical uses of marijuana), and Jack Herer's "Jak Rap" (history of prohibition).

(4) Four Director ShockWave movies (one is a player for the SWA music, the other three are animations on the uses of hemp).

(5) Several donated web sites, including very large sites form the Finnish Cannabis Association (including materials in both English and Finnish, lots of historical information, the hemp movement in Finland, and a Jamaican grow guide) and the Marijuana Policy Project (including lots of information on state and federal laws and information on how to be an effective activist).

(6) Several hemp-related PDF files.

(7) A couple dozen songs in AIFF format. The songs are also repeated in MacroMedia's SWA format.

(8) Compressed copies of many of the pictures. Compressed using Stuff-It format. Uncompresses into TIFF and EPS files. Ready for use in print media and school reports.

(9) Compressed copies of Jack Herer's voice commentary. Compressed using Stuff-It format. Uncompresses into System 7 SND files. Ready for use in radio and video media.

(10) The original custom reader for the Macintosh. Not at all cross-platform, but it is on the disk.

If you are brave enough to try out a CD-ROM that certainly still has bugs and help us get this working in a true cross-platform manner, please contact Stephen Saunders at majik@majik.org, 1-888-HYPERVUE (toll free from within the United States -- not at all sure how that works for overseas), or 0=2, PO Box 4083, Balboa, Calif, 92661, USA. The cost of the CD-ROM is $19.95 plus $3.00 shipping and handling for the U.S. (I don't know the shipping costs for overseas). Payment can be in U.S. dollars (although mailing cash is generally a bad idea), personal checks in U.S. dollars, money orders in U.S. dollars, cashier's checks in U.S. dollars, or credit card (Visa, MasterCard, American Express, or Discover). Credit card payments will be processed by WebPrecision, a for-profit company. Provide your name, mailing address, and telephone number. If using a credit card, also provide the credit card number and expiration date. Checks and money orders should be made out to "0=2". Any "profits" from the sale of these disks will go to H.E.M.P. activities, getting modern equipment for the project (donations of

computers, software, or related peripherals greatly
appreciated), and paying off the cost of pressing the
disks.

After you get the CD-ROM, address technical issues
and bug reports to me (CatGuy@lamg.com or
Merefbast@aol.com).

Thanks.....

> Some would say that an '060 machine is pretty modest as well, in the real
> world.

A 60Mhz Hades is rumoured to give the same level of math performance as a
200Mhz Pentium. I have not seen this in real-life to confirm it but many
Atarians now own Hades060. System Solutions provided the information about
POV-ray tests.

BTW, what is the 'real' world? For a hobbyist computing person a Pentium200
is probably a dream machine, therefore so would be a Hades060 for an Atari
user...

Remember that we're not trying to run the world with our Atari machines, so
the performance you quote as being behind the 8-ball really is brilliant in
the world people use the Hades060 in...

Regards,

Chris Wilkinson, Christchurch, New Zealand.

actually, it didn't. And, as I was able to prove by my own investigation, it was easy to find an iMac anywhere in Toronto during the time period stated, which negated the story. Even a Computer City salesman admitted that the article was "greatly overstated".

>
>By the way...I saw a PBS segment on the Toronto SWAT Team...Toronto looks so
>Americanize....What gives? Does it have a Navy?

actually, we DO have a warship out in the harbour. And we also have a castle. Sure Toronto has areas that look like the US (that's why so many movies are made here where we stand in for Chicago and NYC, and for much more cheaply), but we also have areas that look like areas of London and other cities.

oh, so this now negates your claim that Best Buy was just "waiting for new displays" just about a month ago. And, according to some reports, Best Buy was also blowing out iMacs for as little as $675 US. Does this sound like a company that has faith in Apple? Nope.

>

nope, I predict a mass moving towards Windows boxes. No company who's relied on Avid for past and current projects is going to suddenly switch to another title and have to re-learn all over again.

Translation: TiFKAS is too limited to configure a real newsreader.

Newswatcher. Just Another Newsreader. The newsreader options in Netscape and IE4 (which you swear up and down are "superior Internet

Clients"). All have excellent newsreader and e-mail capability....

try telling that to all the Mac users I've known - they say and use the exact opposite.....

Well, you're wrong. They've been announced, and Toast already supports them.
There are even external IDE drives for iMacs now.

   This is nonsense, all cosmetic crap. It doesn't belong to the OS. I
use Finderpop too, I think it's nice too. I don't see what we would
benefit if it were integrated in the Finder.

>There are loads of other examples but in summary, Finder lacks in many

>

   "Minimize"? "Iconify"? These are alien concepts to me. Just double
click on the window title, and be done with it. Why complicate if you
can make it simple? That's what made Apple famous, anyway... We don't
need 3 ways to get rid of a window...
   I agree with the stuff about copying icons... But hey, how many times
do you go changing all yours icons?

>Conclusion: Finder is not a bad desktop, but dont even try to compare

>

Actually, with Kaleidoscope, you can have ROUND windows. Not only the
Finder is the easiest and most compact desktop, it's also the most
visually configurable, more so than the acclaimed X stuff.

That's what I mean. For a great number of people a Pentium 200 is old hat.
My Pentium 200 just doesn't cut it anymore either.

My dream machine isn't a PC, but if it was it would be a PIII 500 Mhz I
should think.

Granted. I wouldn't mind an '060/PPC Amiga over what I have now either.

I haven't had that problem, so I can't really comment on that.

> Any one of my HALF meg ST's can do that, in single tasking!

Pity you can't be doing something else in the background at the same time.

Amiga has had it since 1985.
BTW, it's the OS that multitasks the software, not the other way around.

Yadda yadda yadda... $19.95 for an Amiga MIDI interface, or I could buy a
soundcard for my Amiga with more features then you could poke a stick at.

> Many musicians are using their ST's for their music. This is due to the
> useless midi that the PC tries to imitate.

Agreed here. Timing on the PC sucks, even when playing MOD's!

> Now the Amiga is alright for repetitive House & ACID type of noise that
> you need drugs to find entertaining; you know the sort of 'so called'

> totally pissed;)

I like real instruments, so this isn't an issue. I don't know what sort of
music is created with an ST, but if it's anything like the shit Celine Dion
and Mariah Carey put out you can keep it.

Hey my kids can do it well... chopsticks using a synth,
> sorry Amiga couldn't cope with that either.

Really?. So the ST has one single use... big deal.
NASA seem fit to use Amiga's, as does the British Naval forces, but what
would they know eh?.

> Curious, when was the last time YOU saw an Amiga in a film, publication,
> or documentary!!!!!!

My local newspaper had an article on Amiga just a few weeks ago. If I felt
compelled to watch the sattelite weather information on TV I would be
watching an Amiga generated screen.

Hey if it wasn't for Atari the Amiga wouldn't
> exist! I wonder why Atari turned the project down when they commissioned
> it!

Atari lost it, and tried to play catch-up since.

> There's another thing that Atarian's are good at, we support our third
> party software producers and prefer ORIGINAL software. Why is it that
> the Amiga user prefers to pay �2 (GBP) per DISK for PIRATED software,

What a load of BS. Atari software piracy was just as bad as on Amiga, and
all other platforms before and after.

>
> I had nearly 100 ORIGINAL software packages, ALL popular titles. I gave

Since when are we talking about the OS? I thought we were talking about the desktop shell? I think Window Monkey is cosmetic, not finderpop though!

> "Minimize"? "Iconify"? These are alien concepts to me. Just double
> click on the window title, and be done with it. Why complicate if you
> can make it simple? That's what made Apple famous, anyway... We don't
> need 3 ways to get rid of a window...

It does not complicate things simply by calling them by there correct terms. What you described for example is called "Window Shading" and takes a lot less time to type then "Just double click on the window title"
Sure, You dont /need/ 3 ways to get rif of a window, but surely it would not harm you or be detrimental in any way.

> I agree with the stuff about copying icons... But hey, how many times
> do you go changing all yours icons?
>

Not very often, but when I do I must go through this tedious process.

> The Finder is the most consisent, and downright easiest to use
> desktop.
>

You could be right there. But, At this point those aspects of a desktop do not appeal to me that much. Maybe when I was a novice my main concern was how friendly it was, but now often times this "friendliness" gets in the way.

>
> Actually, with Kaleidoscope, you can have ROUND windows. Not only the
> Finder is the easiest and most compact desktop, it's also the most
> visually configurable, more so than the acclaimed X stuff.

Yep, actually you dont even need Kaleidoscope for the round windows. There was some rsrc's on one of the lasts MacAddict CD's that let you use them.. really really cool. I do agree that Finder is the most /visually/ config. desktop though, no question there.

I don't know...A P200 will still provide reasonable grunt for playing
Quake. Its only the dickhead PC retailers struggling for their 5-6%
margin who preach that you MUST upgrade to the latest greatest new
hardware every 6 months. Diehard gamers apparently buy the fastest PC's
but I reckon they're stupid...I'd rather buy a PSX and use it on a my
big screen telly and home theatre system...thats infinitely more satisfying
than using a crap 15" monitor and speakers that sound like they
come from clock-radio technology...

> My dream machine isn't a PC, but if it was it would be a PIII 500 Mhz I

Why? No software is written to use PIII properly yet...you might also be
under suspicion of all kinds of criminal activities once servers all
round the WWW note your PIII serial number! :)

> >3 "themes" for MagiC all done by the same guy

Kaleidoscope is quite nifty...you should see this Mac desktop I'm
using right here...its an eyeball strain allrighty!...;^)

Don't worry...when MagiC 6 arrives on my doorstep thats ALL I'm gonna
be doing is creating dozens of schemes! :)

Then again its the 'function' vs. 'form' argument again. In buying
MagiC 6 I'm going to get function AND form...

Kind regards,

Who knows what was going...Lots of misinformation out there...The current
rumor is Sears...

The $675 price was for the refurbs...

You're living in the past... Playing a 3dFX game on a bigscreen TV (TV-out
is common on video cards now) with Dolby surround sound (The better SB
cards amongst others)
and a PII/PIII processor is a fantastic experience. The latest PC's are the
ultimate games machines, the PSX doesn't compare.
The PSX is good value for money though, and very portable which are it's
winning points. (Not to mention the availability of cheap imported CD's
from Asia)
(No, I don't condone piracy, and I don't own a PSX although many of my
friends do)

> > My dream machine isn't a PC, but if it was it would be a PIII 500 Mhz I

But the PIII is *extremely* fast at rendering, which was in part what I
was commenting on.

you might also be
> under suspicion of all kinds of criminal activities once servers all
> round the WWW note your PIII serial number! :)

That's a seperate issue, and not a pleasant one I agree. There are ways
around that problem though as I understand.

The biggest issue re: MIDI over USB is the buffers.. what will the timing be like? Since I've yet to hear of anyone actually using a USB MIDI device successfully, we'll have to wait and see.

No.. it's because it doesn't matter which machine you use. What matters is the WORK you get done with it.

The average PC sold here in New Zealand doesn't have a card with TV-out and those I've seen look terrible on TV, as PC's don't often have close to PAL or NTSC native resolutions. Sound cards with Dolby Surround that I have listened to are MUCH POORER cousins to dedicated Dolby Surround amps. The final nail in the coffin for me is that a Playstation here is cheaper than a 3dfx or Voodoo card...

> But the PIII is *extremely* fast at rendering, which was in part what I
> was commenting on.

Granted. The 'new' commands on the PIII are what I was refering to, as most software doesn't even use PII commands properly yet...

I just don't want to be driven down the same tunnel as all the Wintel users out there. Win98 is a pile of shit that makes even MacOS look good, and new fast hardware to me doesn't fix a legacy of complicated over-bloated OS and applications that Windows has been for goodness-knows-how-long. Workbench or TOS/Magic (maybe MiNT!) are a breath of fresh air to use, and if anything goes wrong I sit happy in the knowledge that it won't require an expensive technician to visit and fix it on my Falcon...I can do it myself!

> Perth, Western Australia.

Perth, WA huh? Tell me my friend, how are employment prospects in Perth today? Not as miserable as here in New Zealand I can bet! :-/

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Did you miss the oportunity with the 520/1040/mega ST?  The iMac has USB...No
slash and hash into the CPU unlike a certain defunct computer line...

iMac 333 Rocks!

Gawd I should take up fishing too!...hook...line...and sinker!

Of course ANY computer with extras like printer, scanner, external hard drive,
etc...is gonna have a spaghetti mess of cables, but this iMac thing seems to
have the potential to really take this to new levels!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

They have the same resolutions as the consoles with a TV-out card. 640x480
maximum with PAL I believe.

 Sound cards with Dolby Surround that
> I have listened to are MUCH POORER cousins to dedicated Dolby Surround

Sure, for most people a PSX is more then adequate but for serious gamers
with loads of cash a PC can't be beat. It's kind of ironic that certain
80's platfroms where dismissed as "games" machines because they had colour
and TV connectability, not to mention a custom graphics chip.

Fair enough, I agree. Some of the new PIII "features" are a little worrying
also.

It seems plenty of Kiwi's have found employment here, so things can't be
too bad on that front ;-)

It depends what line of work you're in I guess, but on a whole the WA is
doing reasonably well. Plenty of employment ads in the papers last I
looked.

Regards,

Clockmeister.

Looks like sinclap's job is done here? So long so well.....Until next time..

By the way, The Jihad 'Chuncks' has been quiet lately since the iMac 333 has been released and the solid financials and stock price of a certain flavor company...

To bad that certain company cannot convence the United States DOD that is it a
solid company and platform......

Maybe if were quite enough, you'll go away.

ROTFLMAO!
Whilst Sinclair may have spouted a lot of odd claims, this must be the
silliest ever!
Portals? Sure, Peter, just like your Push would make the Atari obsolete a

year ago.
Stop making such a fool of yourself, Peter, you know that what you just
said is rubbish.

Hmm.. so you are suggesting that a professional who shoots on Beta SP (still BY
FAR
the most common format for pro video, and the same market segment who use AVID) is
going to compress the video to the DV codec, and then transfer via firewire? Not
likely.. FYI, professionals don't like compression.. and with faster CPUs and
drives, uncompressed video is becoming more and more a reality for even the lower
end pros. The only thing professionals like less then compressed video is
unproven
software and hardware..

Don't get me wrong, I'm looking forward to receiving my copy of Final Cut to use
on
my (work machine) G3 400... but don't be stupid enough to equate Avid and Final
Cut.. they are tools for FAR different parts of the video market. Someone even
moderately familiar with the pro video marketplace would know better!

FireWire and FCP complements the Avid solutions. Both will open and extend
the digital market further than Avid did. Not everyone has the dough to
spurge on the Avid stuff. But with the low cost of FW and FCP will
accelerate the video market further...

Avid is in the Mac market....

Wrong again. They do NOT compliment each other.. they are for ENTIRELY DIFFERENT
SEGMENTS OF THE MARKET.

The people who will buy FCP are the videographers and low budget houses who would
NEVER
buy an Avid to begin with.

> Avid is in the Mac market....

Well, sure.. just for bug fixes/etc from now on. They have announced that the
current
version will be the last major rev for mac. New features will only be available
on Win
NT.

..except YOU are the one who said AVID better watch out. YOU compared the two
solutions,
NOT me. Again, they are NOT EVEN CLOSE to being in the same market segment.

Dead? Bollocks - a dead platform is one that doesn't have any users or
support for it. There are thousands of Atari users all over the world,

doing virtually anything that a PC or a Mac could do, and for a lot less money too. Support? Well there are loads of companies and individuals producing new software and hardware.

Cheers!

James

Um, if the company who made the platform no longer exists, I'd say it's dead.

>

True.

I hope you studied A-level electronics. When the components die of entropy-related reasons, you'll need to whip up a replacement component. Unlike death, taxes, and Reaganomics, things don't last forever.

I must agree. I for one keep three gerbils, eight parrots, two cats, seven dogs, a penguin, and a ferrett up my slacks. And all of them are as "dead" as the platforms Ronald has suggested. I killed the penguin myself, the damn thing reminds me of that retarded-looking linux logo.

He could use an A3000, though. I've got one for sale... :-)

And bollocks to that! There's no Atari in existence which can do 3d rendering at 32-bit high-resolution at an acceptable pace. Not even the ST could! Heck, I prefer the Amiga by far... it could do such rendering, especially if you added an upgraded video card, but why? Truespace 4 (8th generation product which started on the Amiga in 1985 moved to Wintel by 1994 when Commodore snuffed it) on a Windows PC is so much more developed.

As for banal word processing, even a Sinclair ZX-81 could do such work. At a pitiful 40 columns text, but nobody is perfect. And more recent software has features not to be found in the 'good ol' days'.

Oh, what happens when the 20 year old circuitry finally burns out? Most electronic chips have a physical lifespan of 10 accumulated years (24 hours day/7 days week). Nobody's making any more GTIA chips, the last I heard.

Brian Van TIlborg wrote:

> The Atari 520ST is the most multi purpose multi functional computer ever
> made for the home computer market in 1985.

You ought to go into comedy, you've made me laugh rather hard. The Amiga used
less memory and did a hell of a lot more. The ST is made of generic rubbish

chips whereas the Amiga was specially designed to do all sorts of wonderful things. And both had cost around the same price.

>
> Today in the year 1999 the Atari 520 ST is still being used on a daily basis by users who chose to purchase Atari over the lesser brands and more expensive brands.

Uh-huh. Last I heard, you couldn't get a new Atari ST since 1994 (were all ST-type computers discontinued in 1993, as I had heard?) You must opt for a used model, which means its lifespan is somewhat limited.

>
> While other less educated users have paraded through a long line of newer computers trying to keep up to date the ST remains a Stable element to all Atari users.

Right... if any computer could *really* be compared to today's computers, the Amiga is the only one. It pre-emptively multitasks. Screw that, it does multitask. The Amiga has 4 independent CPUs whereas PeeCees, Crapintoshes and STd's have but one. The only OSes which could compare to the Amiga are OS/2 (which is a bloated waste of time) and BeOS (which deserves to be the future, not bloatware NT which is sluggish by far in comparison). With the native ECS or AGA chipsets, the amount of things you could do with video and the workbench desktop are staggering. The ST up to date, stop making me laugh! The ST audio is shite, too. And Amiga's 8-bit audio is still viable. Amiga's FM synth is equal to PeeCee's MIDI. Since PC FM synth is still shite and will always be shite,Uncreative Labs (the 'standard') decided to have everybody rely on big-ass bloated .WAV files - almost as bad as raw sound sample data in terms of size. When PeeCee users say the sound is better than the Amiga, they don't take this small reality into account. PeeCee rules because of a damn recording, not real effort on the part of hardware. The SB Live product is finally duplicating some Amiga audio features like the ability to play several sounds simaultaneously from multiple programs (took 14 bloody years, though!)

>
> Clearly no other computer from 1985 has survived the test. When purchasing a computer that won't be obsolete, the ST has proven that the life span of a computer is not 2 years, but that it is 15 years and more.

Liar liar, wiener on fire. Go study up on the Amiga.

>
> Where are the expensive Macs of yesterday, today? While once considered the leading edge, clearly all Expensive macs have proven that you have merely flushed your money down the toilet.

For once, I agree. The Mac really hasn't been updated for 8 years. MacOS 8 adds colorful backgrounds and other useless rubbish, but it does NOT address true multitasking or crash protection! Ouch! There's no way I'd ever invest in Apple if this is how they operate. Why did Microsoft even bother with them, I don't know...

>
> IBMPC compatibles of the same era are long gone into the bit bucket. Not capable of anything then, today they merely show up in the technological waste bin.

I totally agree. IBM designed the PC with generic hardware and inferior technology. The Intel 808x (8 or 6) were designed badly "brain damaged" has been used to describe the chip. IBM knew their computer would sell because of their name. They had a monopoly on midrange computers. They wanted to ensure that no desktop PC could ever rival a midrange so they made it with crap. Of the day, there were far superior 8-bit chips available. And the Motorola 68000 did exist in 1981, which was a coherent design unlike Intel's offerings. IBM could have been 4 years ahead of its time by introducing a Motorola CPU-based system, but no. They had to be shitheads. I'd love to go back in time and castrate the fathers who allowed their offspring to design the PC... then we'd have something better to nitpick.

>
> Amiga? Strange but true the 1000 Amiga was both expensive and rough around the edges. Long an Atari adversary, the amiga was a failure in its early incarnation and early users paid a hefty price for that 256 k machine.

Bollocks! The Amiga 1000 was half the price of your comparable 80286 IBM PC. where the hell are you getting your figures: Drunk-Accountants-r-us? The fucking thing may have cost more than the Atari ShiT, but the Amiga had multiple processors which were specially designed. The ST, like Mac and IBM, were made with generic hardware.

>
> But the 520ST with all of its faults in its rush to the market, truly was the best compromise in all things computing. Proof is in the fact that no other computer from that era has software written for it in todays market.

Like so many IBM and Microsoft people have said, it is better to have a product in the market, regardless of quality, than having no product while working out its bugs. Blame capitalism, I'll be happy to. Your proof, btw, is conjecture.

>
> How could one ever complain of a computer where you can get NEW software 15 years after it release. This software allows for all the modern uses that they current platforms demand.

Oh, are you feeling special or something? The Amiga is in the same boat as the ST in this regard. My god, people still write games for the Atari 2600!

>
> Clearly computers 2 years old are having difficulty running the latest software for their OS, resulting in forced obsolescence of computers with

> superior hardware and processing power to the ST.

Uh-huh. And I have three testicles. Want one? Remember, society is built on the acquisition of money. This is why people are engineering this stuff so people upgrade.

>

> platforms from the warehouse. They are still living in the cooperative
> state.

hahahahahahahahahaha!   TOS is Jackie Tramiels' crap version of DOS. And GEM came from a different company. Atari was so lame they couldn't write their own OS! IBM was just as bad! And the ST does not pre-emptively multitask. Like the Mac, Win 3.x/95/98, and so on, the ST co-operatively multitasks. In other words, it doesn't multitask. What the hell is this Magic rubbish anyway? A replacement OS for the ST which won't run current ST software?

>

> Other computers from this era CAN'T DO IT PERIOD.

STOP THE BLOODY YELLING YOU TWIT! Proof, please, on how the ST surfed the web. The web was still classified by the military. And more Amigas got into top-secret US installations than STs. Yeah yeah, the ST of 1985 had color. So did the Amiga. So did the PC, for whatever that was worth. Big frigging deal. God, stop being an imbecile! "Other computers from this era CAN'T DO IT PERIOD" is a load of rubbish. The Amiga certainly had 16 colors. Jeez louise, the Amiga of the time did 4096 colors at once! Your ST couldn't get ANYWHERE NEAR THAT! I may be slightly ignorant on the ST, but you are way off your rocker in terms of comparing the Amiga to the ST...

You're right. It's cheap. it's a useless pile of shit.

>
> And it gets better. The ST is the lowest common denominator. It can do it
> all. It does all functions with very respectable speed. The ST is the
> sportscar of computing.

You mean it gets more amusing. The ST's interface is the most backwards I've ever used. Same rubbish was made for DOS until Apple sued the makers of GEM for releasing it on DOS (but why not Atari...)... Even the Mac was easier to use.

>
> After the ST the rest of the Atari line offer improvements that enhance
> using your TOS based software.

Uh-huh. I have a bridge somewhere in New York I can sell you.

> US:-).

Well, duh. The iMac is the same 8 year old crap but with a newer CPU and in a pretty case. Apple ran out of ideas for selling the same old same-old... :-) The problem with cults is, the insane leader manages to take his desciples and lead them into mass-suicide.

>

> The other computer is obsolete and will be known for its significants as
> being the last nail in the coffin of Apple computing.
> Too different, too little, too late.

The sooner Apple goes, the better. They're damn lucky they made it this far. Never before, Microsoft aside, have I ever seen sucha truly visionless company.

>
> Perhaps it is time to find a used ST and join in on the fun of having an

Yeah, Hitler and Jim Jones were great people to hang around, too. Judging people by groups sounds prejudicial to me, let's do it on a one-by-one basis.

>
> With the Atari, the computer speaks for itself and the egos are left at the
> keyboard. There is little to brag about because it just does it. Thats it,
> thats all, its that simple.

Voice synth? I never knew the ST could do that. For 1985 the Amiga could... your entire post sounds like a brag, what the hell are you implying by your comment that there's little to brag about? Unless the ST is such a little pointless piece of paltry silicon, of course.

Well, you're going to get a lot more replies than you deserve. You borderline the level of a troll. And trolls ought to be avoided, not indulged with responses.

--- original post with my reality-oriented comments.

Brian Van TIlborg wrote:

> Hmm, nope, everything is correct as posted.

In your opinion... I'm not perfect either, but reality can prove us both wrong. It'll prove you wrong just a little more quickly. :-)

> Perhaps you could tell me what
> part confuses you. It is posted with a post marketing enthusiasm that is
> simply meant to catch ones attention.

It is not enthusiasm when you run around blindly criticising other computer brand without having a proper knowledge of them. If you do know the competing brands and lie or not specify certain information, it makes you look like a real gastropod (slug). With luck nobody else will catch that attention. You were mostly right about the Mac, tho.

> The facts are the facts.

Well, you've omitted or lied on a couple of them - hopefully out of ignorance and not out of sheer deception. I don't like deception, you see...

> I would be
> suprised if you used an ST on the internet? In fact I haven't even posted

So bloody what? Many people use Amiga 500s on the 'net, too - and they can more accurately draw the pics than your ST because of greater color depths. And that's a fact.

Define outrageous!

> I can only think of two possible answers to your rude reply.

Well, when you make a rude post, do you expect candy and roses?!

>
> 1) You are an ignorant (lacking in knowledge) user of more powerful Atari
> equipment and you have failed to include the ST in your thought process.

Takes one to know one and you've definitely shown ignorance, unless you lied and I've said I don't like people who attempt to deceive in order to improve their own status...

>
> 2) You are a user of another platform and quite frankly are clueless.

Well, should that really matter regardless of the truth? I dare say he may be wrong on the drugs, but you're definitely acting odd and your delightful comment about "I can only think of two possible answers to your rude reply" since your post was extremely rude and inaccurate merely makes some wonder if you actually are... or just plain nuts. Amiga nazis, Linu-nazis, os/2-bigots, and the type for every platform do exist. You're nuTS. (TS backwards is rather deliberate. :-)   )

> Normally these people own IBM PCs and MS products

Well, I currently have a PeeCee clone and BeOS, WinNT 4, Linux (which I don't use since it's crap), and OS/2 4. I also have an Amiga 500 and 3000. I used to own several Atari 8-bit models. I nearly bought an Atari ST -- and then I saw the Amiga... bloody glad I didn't buy the ST.

> , however these users
> usually know nothing of Ataris nor can they be bothered trying to find out
> anything about them let alone waste valuable bandwith replying.

Um, your ignorance prejudice is showing AGAIN. Kindly stop the prejudice or stop wasting valuable bandwidth posting (and replying).

> Therefore
> you are most likely a NON INTEL user.

You'd better be right in your guesses! You're definitely wrong about me since you think that just because I own and use a PC with Windows NT on it that I'm totally ignorant of everything else that time has presented.

> Leaving only Amiga and Mac. Amiga
> users have bigger problems of their own than to worry about Atari, and the

> No big deal.

Aw, man! I've got a year's worth of hair-removal wax kits! You're boasting again...

>
> Since you are rude

I can't imagine why he was...

> , while I am only trying to have some fun in
> comp.sys.atari.advocacy

Yup. Fun is defined by starting a new thread which unjustly puts down others (by accident or by design) in order to raise your own status. Don't worry. You'll get a lot more rude posts. Not by me. I've had all I need to say regarding this, unless you make a really good response to all this!

> I think you have received more of an answer then
> you deserve.

Well, you're going to get a lot more replies than you deserve. You borderline the level of a troll. And trolls ought to be avoided, not indulged with responses.

> I am no fool.

That's debatable!

And bollocks to this! ('scuse me while I scratch mine :). Some Ataris exist that
can handle this. A TT for example renders POV-ray scenes quite rapidly. A Falcon
is acceptable too. Then of course a Hades060 is 30 times faster than a Falcon with
POV-ray! Video oriented software is a strong point for the Amiga, but I ask
you to
define an acceptable pace. 'Proper' rendering software is slow on ANY computer
that
doesn't have a 6 figure price tag...if it isn't slow then it cheats and the
quality
of output reflects thus...

You had the guru meditation, we had the bombs ... have you ever heard
the story about how the amiga concept was bought by commodore just
hours after atari thought of buying it? Atari Corp had a contract and
the amiga guys did not want to sign it right away. Commmodore put two
bottles of booze up and the guys signed shortly afterwards.

>> Today in the year 1999 the Atari 520 ST is still being used on a daily

Correct, there are only Falcon/TT clones today and the ST wasn't
manufactured after the Falcon was introduced, I think with exception
for some STe's. How many Amiga clones exist today? And how many
laptops were made?

>> While other less educated users have paraded through a long line of newer

>Amiga is the only one. It pre-emptively multitasks. Screw that, it does
>multitask. The Amiga has 4 independent CPUs whereas PeeCees, Crapintoshes and
>STd's have but one.

You are talking of CPU's here? Not co-processors wich the Amiga AND
about every other M68K-based computer has? But if you really mean
CPU's then you should know multiple CPU's has been used in PC's and
Mac's already, but not in Atari's as of yet. Not that Amigas have used
multiple CPU's yet either as of what I've heard. And guess what,
despite what you think, the multitasking of Magic and MiNT is *real*
and pre-emptive.

>The only OSes which could compare to the Amiga are OS/2

BeOS lacks applications, NT is old, MacOS is sluggish. Windoze isn't
even operatable. Say, how is it to use the good'ol interlaced
flickering workbench? You got all the apps you could ever want eh? I
use to laugh every time I watch my pal use his amiga for real coding.
The guy know how to code but the enviroment he's in looks like a
flickering piece of shit. I would have to say the much more up-to-date
OS's of the Atari looks, ah let's say - a bit better.

>The ST up to date, stop making me laugh! The ST audio

The Falcon has outstanding audio, the ST had one drawback and that was
that it had only mono. The midi however made Atari the industry
standard music machine. It has been said by musicians that even todays
Mac's and PC's have a hard time to beat the accurate midi timing of
the good'ol ST.

ST? Generic hardware, true. Multiple processors true. Multiple CPU's
nope - neither did amiga/PC/Mac at the time. The amiga was more of a
hardware hack than indusustrial design.

<Market part cut out>

<new softwares part cut out>

<strange part cut out>

<cut>

Bullshit. GEM was made by Digital ... a better buy than to hire some

freaks to hack together some sheit. Pre-emptive multitasking has been
around for a while.

<some stuff cut out>
>PERIOD" is a load of rubbish. The Amiga certainly had 16 colors. Jeez louise,

The amiga had 32 colours, the ST 16. Special techniques allowed 4096
colours on old amigas and 512 colours to be displayed on old ST's.

<arguments cut out>
>Go get a date. You need one worse than I do.

The Mac is the easiest computer on the planet to use, it's a fact. The
old ST operating system is as inspiring as the old amiga workbench. If
you compare the oldest OS against another manufacturers newest it
can't really be called a comparison. Compare new workbench to new
Atari OS's and you might think twice before making dumb comments. Too
bad I beleive you're way too narrowminded to do a fair comparison, but
then again I'm probably that too ;)

The iMac has a pretty new architecture. The fanatics are to be found
amongst any computer's users. The amiga hasn't had as many ideas that
hit even the prototype level ... Atari did ... say no more

>> The other computer is obsolete and will be known for its significants as

Many things can be said about Apple, and being visionless isn't one.
The PC market however hasn't come up with much the last 10 years.
Apple will exist as long as it fills a function the PC does not ...
and the MS-PC does have many weak spots. Apple will not fall in the
comming years yet.

<weird angle cut>

You remember the voice in the "Das Boot" music? Or perhaps the
classical metallic voice saying "Techno" in a lot of old techno music?
Guess what musicians used? They used the Atari text-to-speech
programme.

The amiga was and still is like any old "forgotten" platform, just like the atari. Both have it's supporters and both camps are about equally fanatical. Some companies brings life to the old names by designing new hardware that supports some of the old software ... doesn't differ much.

I think the real difference was that most of the amiga users were the average "elite d00d" into piracy, playing games and not much else. The Atari users where involved and creative.

Besides that the amiga is plain uggly!

I have an Atari 400 System and Software for Auction on eBay. Bidding starts at $9.00. Below is a description of the items for sale. You can view the auction at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=85521809

Here's a copy of the item list:

Hardware:
  Atari 400 - 16 K RAM (appears to work fine... I've plugged in a few carts and come up fine)
                         (it's missing one of screws in the case).
  Atari 410 - Datasette Recorder (works fine recording and reading new programs,
                                  but has problems reading some old tapes)
  Atari 400/800 power supply (fuse has been bypassed, required taping case, works great)
  Manual Switch box (spade plug replaced with wire... works fine)
  XM301 Modem (300 baud, direct connect modem... guess this one's more for nostalgia)
              (I have not personally tested the modem, it's condition is unknown)

Cartridges:
BASIC
Joust
Star Raiders

Tapes: (the programs appear to be intact, but I they have problems with the 410 included... I think it has to do with the age of the 410 and not the tapes themselves)

->Um, if the company who made the platform no longer exists, I'd say it's dead.

And I say still...NOT! Is it so hard to comprehend that 3rd party and after-market companies are now writing the software and releasing new hardware, including clones? If the original poster had said, "Atari Corp. is dead. Period.", then I could have agreed. There is no *way* however, that I can say with any honesty that the Atari "platform" is dead...

->I hope you studied A-level electronics. When the components die of
->entropy-related reasons, you'll need to whip up a replacement component. Unlike
->death, taxes, and Reaganomics, things don't last forever.

Entropy always wins, eh? <grin>

Again, read the paragraph above. Its not like I'm using a piece of equipment that can't be replaced. There is Hades, Milan, C-Labs Falcon clones, and the Phoenix project to choose from.

Looks like somebody has not been keeping up with current Atari events! ;-)))

->You ought to go into comedy, you've made me laugh rather hard. The Amiga used
->less memory and did a hell of a lot more. The ST is made of generic rubbish
->chips whereas the Amiga was specially designed to do all sorts of wonderful
->things. And both had cost around the same price.

I'm curious about some of these statements. I bought a 520ST in 1985 for $399.00. The Amiga A1000 couldn't be touched for that.

What makes you think the Amiga used less memory? The A1000 was divided into 2 256k sections, one of them Chip Ram, which is used for sounds, pics, etc. In other words, you couldn't load a 300k picture into an A1000 in 1985.

->Uh-huh. Last I heard, you couldn't get a new Atari ST since 1994 (were all
->ST-type computers discontinued in 1993, as I had heard?) You must opt for a
->used model, which means its lifespan is somewhat limited.

The 520ST through the Mega STe are all out of production now. The Falcon and TT are no longer produced but clones are being made that fit the bill quite nicely, thank you.

->> While other less educated users have paraded through a long line of newer
->> computers trying to keep up to date the ST remains a Stable element to all
->> Atari users.
->
->Right... if any computer could *really* be compared to today's computers, the
->Amiga is the only one. It pre-emptively multitasks. Screw that, it does
->multitask. The Amiga has 4 independent CPUs whereas PeeCees, Crapintoshes and
->STd's have but one. The only OSes which could compare to the Amiga are OS/2
->(which is a bloated waste of time) and BeOS (which deserves to be the future,
->not bloatware NT which is sluggish by far in comparison). With the native ECS
->or AGA chipsets, the amount of things you could do with video and the workbench
->desktop are staggering. The ST up to date, stop making me laugh! The ST audio
->is shite, too. And Amiga's 8-bit audio is still viable. Amiga's FM synth is
->equal to PeeCee's MIDI. Since PC FM synth is still shite and will always be
->shite,Uncreative Labs (the 'standard') decided to have everybody rely on
->big-ass bloated .WAV files - almost as bad as raw sound sample data in terms of
->size. When PeeCee users say the sound is better than the Amiga, they don't
->take this small reality into account. PeeCee rules because of a damn
->recording, not real effort on the part of hardware. The SB Live product is
->finally duplicating some Amiga audio features like the ability to play several
->sounds simaultaneously from multiple programs (took 14 bloody years, though!)

We didn't have multitasking at first, I'll gladly admit (unless you count the limited multitasking that DA's do), but we do have several flavors of multitasking now. Geneva co-operatively multitasks, and MagiC as well as MiNT pre-emptively multitask.

I was a bit disappointed in the the stock ST's sound. However the STe was

much closer to the Amiga, and (face it!), the Falcon's audio blows the
Amiga away...

->Liar liar, wiener on fire. Go study up on the Amiga.

Don't have to, I've owned an A1000, A2000, and A1200. I've still got the
A1000, simply because I value Jay Miners signature. Jay was also very
instrumental with the Atari 8-Bit line as well. ;-)

->Bollocks! The Amiga 1000 was half the price of your comparable 80286 IBM PC.
->where the hell are you getting your figures: Drunk-Accountants-r-us? The
->fucking thing may have cost more than the Atari ShiT, but the Amiga had
->multiple processors which were specially designed. The ST, like Mac and IBM,
->were made with generic hardware.

Yes, but the original poster was talking about compared to the 520ST. Oh, I
see you do concede the price (finally). Don't forget that the Atari ST line
could do MIDI, standard, and you still can't on an Amiga (out of the box).

->hahahahahahahahahaha!   TOS is Jackie Tramiels' crap version of DOS. And GEM
->came from a different company. Atari was so lame they couldn't write their own
->OS! IBM was just as bad! And the ST does not pre-emptively multitask. Like
->the Mac, Win 3.x/95/98, and so on, the ST co-operatively multitasks. In other
->words, it doesn't multitask. What the hell is this Magic rubbish anyway? A
->replacement OS for the ST which won't run current ST software?

You can effectively pre-emptive multitask with just about any Atari today.

MagiC is a complete OS replacement for Atari computers that does do
pre-emptive multitasking. In full. Its very compatible. Guess what I'm
running on my Falcon? MiNT. Its a Unix clone (mixture of Linux, netBSD,
and S4R4), so yes - it does pre-emptive multitasking too... ;-)

->STOP THE BLOODY YELLING YOU TWIT! Proof, please, on how the ST surfed the
->web. The web was still classified by the military. And more Amigas got into
->top-secret US installations than STs. Yeah yeah, the ST of 1985 had color. So
->did the Amiga. So did the PC, for whatever that was worth. Big frigging
->deal. God, stop being an imbecile! "Other computers from this era CAN'T DO IT
->PERIOD" is a load of rubbish. The Amiga certainly had 16 colors. Jeez louise,
->the Amiga of the time did 4096 colors at once! Your ST couldn't get ANYWHERE
->NEAR THAT! I may be slightly ignorant on the ST, but you are way off your
->rocker in terms of comparing the Amiga to the ST...

I view 4096 color Targas on my stock Mega ST, and you can view 19,000+ color
pics on an STe...

'Nuff said... ;-)

Hi K.Hampf! I agree with what you say, just thought I'd throw something else in here to show Mr. "infinity rising" that we are familiar with the other platforms.

The early Amiga's 4096 color mode was known as HAM (hold and modify). It suffered from being slow (taking almost all CPU time), and also had "fringing". It is a hardware feature, and very nearly didn't make it into the Amiga design. Some creative users added interlaced HAM, which came to be known as "Sliced HAM". AGA models added super HAM, with increased colors, but still suffers from fringing.

The Amiga also has an "extra half-brite" mode, where the intensities of the original 32 colors are changed so that you get 64 colors. Some games put this effect to good use. "Black Crypt" springs to mind.

Catch ya later... ;-)

Yes, but fun. Clearly most of this is the result of the frequent Mac poster in this NG. I don't think anyone cares in advocacy. Its just fun. Alot more fun then nothing happening month after month. It isn't comp.sys.atari.st where we take things more seriously. Besides I can see you have bigger problems. On 30 Mar 1999 02:13:59 , "Edward Williams" wrote: >Who Cares....... >You might Like Atari,MAC or PC >but who really cares when the job to be done with a computer is more than >just window dressing.... >I like All Computers some more than others but I DON'T FIGHT over which is >best >The Atari is a dead platform as is the Amiga and others >but if it makes ya happy then use it > > >------------------ > >Edward Williams >Tchermok@flash.net

LOOK AT THIS LIST!!!

>68 8-Bit Atari Computers
>(5x800,3x400,6x600XL(64K),12x600XL(256K),3x600XL(512K),14x800XL(256K),15x120
>0XL(512K),5x130XE,2x130XE(1088K),3xXEGS(128K)

I have none of the above.

>21 Atari ST Computers
>5x520ST,7x1040ST,3x1040STe,2xMega ST,2xMega STe,1xTT,1xFalcon

5x520ST, 1x1040ST, 1x1040STe, 1xMega 2, 1xTT, 1xFalcon (of course I just purchased all of these in the last year barring 1 520ST which has been with me since 1985.

13x PC Clones XT-PII-450

Man you must have a STORE. I have had as many as 20 various PCs but unloaded them all.

>27x Macs Mac128-iMAC

Yup, you have the computer bug real bad.

>Amiga 1000x2,Amiga 500x3,Amiga 2000x2,Amiga 2500x1

Had a 1000, 500, and what I consider the first decent Amiga, the A3000.
Then I had a few 4000 and videotoaster.

>1 Kaypro 10,1 Zenith Z-100,2 Olivetti L1 M20's,50+ TS/1000

Clearly you are a museum:-).

>Close to 87,000 Floppies
>900 CD's
>And Thats just in the house

And just think, there must not be room for the C64:-).

Well, I am neither for or against computer wars. Computers are different.
This is advocacy where one should be expounding the virtues and features of
the computers they use.

As posting merely stating the STs capabilities can offend
readers.

Regardless, I believe you have a hard enough time just trying to remember
how each OS works.

I can just see cpm and wordstar being no problem to remember at all:-).

Later Brian.

If you are after anything Atari wise, then let me know;) I don't mind
posting things to the USA, I've done it a few times.

If you want a list, although I've not got around to updating it yet;), drop me a line and I'll send it via email.

I also have a web site, and yes you are correct as this hasn't been updated in a month. There is only a certain amount a single person can do in a day, and when I have to deal with side effects of my medication it doesn't help.

I have the following for items for sale. The only rule is that the Jag, Jag CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 2 Power Pads, manuals, and boxes.

Cartridge Games:
Alien vs. Predator   Cybermorph   Fight for Life
Iron Soldier   Kasumi Ninja   Raiden
Rayman   Theme Park   Zool2
Trevor McFur in the Crescent Galaxy
Val d�Isere Skiing & Snowboarding

CD Games:
Blue Lightning   Myst   Vid Grid

BTW, I am not leaving the Atari scene.

Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI,
ExtedDos Pro, ICD HD utilities.

NO, You can't get them in your local CompUSA.
They sell these in the same stores where you buy the 12000 new developed 3th
party products and 1600 new software titles specially developed for the
iMAC, didn't You notice ?

Cheers from Belgium

Dennis

Yeah, well maybe so in the States, but here in Europe the situation is different. In the last Atari Computing, published here in the UK there are 14 adverts from companies big and small, and those are just in the UK. Virtually every country in Western Europe (and some in the East) you could name has companies that primarily exist to serve the Atari platform.

Try it - name a country and I'll tell you what is there. And the web is still live and active, just do a search and you'll see. Try ASH's website for example. They are still producing quality software, including the MagiC pre-emptive multitasking system (for ALL Ataris, not just the power machines) and CAB, currently up to version 2.7 in English, is a web browser thats just been released for the iMac.

http://members.aol.com/ashinfo/index.htm

Cheers!

James

Well I can't help that you Americans do not know ENGLISH when you see it.
Those messages still DO NOT MENTION Atari, nor attack them. There's no
context in them that relates to Ataris.

Cheers!

What I meant to say was that you just gave a positive spin to the reality, which is that old Ataris are not good Internet machines for the majority of people.

The fact that you're happy with what your 15 year old machine can do on the internet is nothing outstanding. People will settle for next to nothing these days. I mean, if you don't expect much, whatever your old equipment provides will be plenty for you, and this surely seems to be your case here.

Now, what I found laughable is the fact that you try to apply YOUR reality to the world at large. Most people won't put up with bad performance, tricky installations, etc. You've got to wake up and realize the computing world has changed, and it's been a while since that happened.

It would've been far more interesting if you had written a report about your ST and how you can get by with it on the internet, but all you did was deny the fact that there are cheap machines these days that can do the same job, only far better.

>I can only think of two possible answers to your rude reply.
>

Was it rude? If you thought so, I'm sorry, but it was purely in the advocacy spirit :)

>1) You are an ignorant (lacking in knowledge) user of more powerful Atari
>equipment and you have failed to include the ST in your thought process.
>

Well, I do have a "more powerful" Atari than you do, but barelyt :) I got a 1040STe... I know fully what it can do, and what it can't.

>2) You are a user of another platform and quite frankly are clueless.

>Therefore you are a Mac user with limited knowledge.
>

Wow, almost there, Sherlock :) But I guess that checking the headers gave you a better hint :P

Anyway, I am a Mac user indeed, got 3 of'em, and I do have some sort of knowleadge about Ataris, and assorted platforms (Amiga including).

>Luckily for me I have been winning bets and now I am on my second year of
>FREE INTERNET ACCESS for merely hooking up and using my ST on the internet.
>No big deal.
>

What bets?

Just because YOU can get on the internet doesn't mean what you see and use is what most people would. I wouldn't settle for a 16 colour,

lo-res screen. You do. See?
Mind you, I can get my Commodore on the internet, with a shell account and a 2400bps modem. Will I win any bets? Of course. No one would think an old 8 bit computer can connect on the internet. But is doing so practical, and USEFUL for me, or the majority of people? I don't think so...

>Since you are rude , while I am only trying to have some fun in
>comp.sys.atari.advocacy I think you have received more of an answer then

>

I am not rude. I was just truly gobsmacked at your post. I couldn't believe how far detached from reality some people can be these days.

>I am no fool.
>

You might not be a fool, but by posting things like that, you surely make yourself look like one.

Wake up, man. It's the nineties, almost 2000. The same people that
bought the stupid 286/386s are now using a machine that's probably 100
times faster than yours, and costs the same as your ST did. And you?
You're stuck in the past.
And the folks who bought Macs with small b/w screens are now enjoying
their $800 iMacs, with big and bright 15"s...

   Humm... My Mac is damn fast at rendering Bryce scenes, and if it's
"cheating", I honestly can't notice. What I CAN notice though is that
the quality of the render, at 1024x768, is better than anything that POV
ray (the only 3D renderer for Ataris?) will ever do.

> Ask GateWay...The question is can you buy a TOS PPC laptop today ?

Well Kinda. Many people buy PowerBooks, such as yours, and run
MagiCMac on it. MagiCMac lets people run MagiC, a preemptive
mtasking, fully modern, TOS compatable environment. I use it on
my iMac because it blows MacOS away. Im not going to argue with
you about it though, there is a demo available which you can
download and try for yourself. Make sure to get the replacement
desktop Jinnee 2.01 demo too. If you want an english Desktop, get
Thing 1.27.
The newer versions of Jinnee now let you launch Mac applications
from the jinnee desktop, so I have MagiCMac boot up
automatically, and when I want to use a Mac app, I still dont
have to use slow finder..
You can find links for all of this on my page.
After using Jinnee, I dont know how you could go back to finder.
PS; are there any replacement desktops for the Mac? Ive heard of
some but am not able to find any.?

Amiga's already have 060/PPC and soon will have G3/G4. Both can be used
simultaneously from what I understand, so dual processing is available on
Amiga's if what I understand is correct.

And guess what,

A flicker fixer, or better still a graphics card fixes that. Maybe I'll get
that Voodoo addon that is in production as of now...

I would have to say the much more up-to-date
> OS's of the Atari looks, ah let's say - a bit better.

Really?. And have you seen Workbench lately?. Looks like the Atari OS's
have only just caught up.
And with Amiga there are no arguements over which OS is better for the
Amiga, unlike some of the BS i've seen in c.s.a.st.

A hardware hack?. How was the Amiga less of an industrial design then say a
Mac or ST?. And I might add, the Amiga didn't have a 40% failure rate out
of the box, unlike early ST's.
Not to mention the fact that the ST was virtually unexpandable, and had all
it's chips (except ROMs) soldered in. That reeks of cheap and nasty.

What, a hacked CP/M/GUI/68K/DOS kludge is better then an OS specifically
written to work 100% with the hardware?. Get real.

64 on EHB modes, but that mode wasn't available on the A1000 - at least not
the first ones.

I've used both, and Workbench wins hands down but possibly only because
I've had far greater exposure to it.

Through the YM soundchip... bwahahaha. The Amiga text-to-speech is widely
regarded as one of the best implementation for a home computer, still.
Better check your Das Boot sources too.

The Amiga is far better supported, with more addons then you can poke a stick at.

> I think the real difference was that most of the amiga users
> were the average "elite d00d" into piracy, playing games and not much
> else. The Atari users where involved and creative.

Now that is just plain BS. Amigas are still being used for professional
quality video, art and sound production, as they have always been used for.
Most Atari's where used for games also, and in any case, the creative use
of Amigas is well documented.

> Besides that the amiga is plain uggly!

Which one ?. But all those expansion slots Atari users don't have make up
for any "uglyness" you may perceive..

->How many 060/PPC soon G3/G4 Atari's exist today?.

Hmm...not sure about the exact number but there is/was the Medusa,
Hades, Milan, DirecTT, and you need to go to Titan Designs web site
for info on the new Tempest board for the Falcon that will support
256 megs of SDRAM, and a G3 PowerPC at 266mhz. Neat, eh? ;-)

->A flicker fixer, or better still a graphics card fixes that. Maybe I'll get
->that Voodoo addon that is in production as of now...

Right. Just like many of us are looking at the new Eclipse board that will
support PCI graphic cards. Specifically the ATI Rage II with 4 megs of VRAM.

->And with Amiga there are no arguements over which OS is better for the
->Amiga, unlike some of the BS i've seen in c.s.a.st.

Thats not the whole truth and you know it. There has been some very

bitter arguments in the Amiga newsgroups over New Icons, Magic WB,
and half a dozen other WB enhancements...

->The Yamaha chip was a relic from the 8 bit days. It in no way was

Comedy, perhaps. I enjoyed reading your posts. You have alot to say about
the Amiga considering I only briefly mentioned the A1000. I am comparing
only computers of 1985. My 520ST has been with me the entire time. The

A1000 is one of my favourite computers. In many ways it is a statement in computing. However it does not do a hell of alot more with 256K. My A500 I purchased in 1987 with 1meg and a second DS drive kickstart 1.2 and workbench 1.3 was better than the A1000 yet a compromise. Unfortuneately after switching to it, I found it lacking in too many areas short of playing games. Many people switched to Amiga with the coming of the A500.
I sold mine, got the memory upgrade, another 520ST and a Laserprinter.

The A2000 is a different story altogether especially once the toaster actually came out. However when I got my A3000 around 1990, I was much happier as it finally seemed complete and I followed this up with 2 A4000s.
Lightwave, Imagine and Calligary finally replaced the modelling of Cybersculpt and its heiarchial object structure. I could go on, but I won't and people will be thankful:-). But in essence, I had roughly $80000 tied up in Amiga computers, Laserdisc recorders and numerous video cards, by 1991-2. The Falcon was demonstrated to me by Atari before its release and I decided that it wasn't worth taking the chance on regardless of how impressive it appeared. Therefore by 1992, I had pretty much abandoned the Atari Platform, short of using the 520ST for Calamus.

Amigas are long gone, (actually they were stolen TWICE) losing valuable data, (Stole the backups too:-(.) and now all animation is done on far more powerful PCs.

In the meantime after a 7 year absence with Atari, I discovered that this 520ST is quite clearly still supported. I installed STing and had my PPP/PAP connection. This was the only kind supported by our provider.
I was shocked to discover there was still alot of activity in the Atari newsgroup. I thought Atari was long gone. But the users aren't. I was absolutely suprised to see all this software running on my ST which never even had the OS upgraded. Hell, I was suprised to see new software let alone any past 1992.

So in a nutshell, this basic little machine is working well beyond my expectations for it. The A1000 (although I am very close to getting one just to have gather dust:-) has a few to many limitations, but does have a cult status in a way. Although I don't believe you own one. In 1985 these machines were very expensive.

 >Uh-huh. Last I heard, you
couldn't get a new Atari ST since 1994 (were all ST-type computers discontinued in 1993, as I had heard?

I am speaking of purchases in 1985. Today you can buy an ST for $5.
I picked up a MegaST for $20Cdn. It is simply very cheap to have alot of fun, with a good group of people.

) You must opt for a used model,
which means its lifespan is somewhat limited. >

This 520ST is 14years old? How limited is that? All computers lifespans are limited. The software that I can purchase today runs on my 14 year old machine. The shareware and pd programs written in 1998-9 run on it. And if these programs were crap, I wouldn't even bother turning on the 520ST. Plus I like the interaction with the software authors.

>Right... if any computer could *really*
be compared to today's computers,

The comparision is more to what todays computer uses are for. The ST and Amiga because of their graphical abilities have been able to handle animations and pagelayout. This leads to their ability to adapt to the current status of the WWW easier. The times have changed and a computers ability to adapt to the change determines its obsolescence.

the >Amiga is the only one. It
pre-emptively multitasks. Screw that, it does multitask. The Amiga has 4 independent CPUs

Clarify this?

whereas PeeCees, Crapintoshes and >STd's have but one.

Yes.

>With the native ECS
>or AGA chipsets, the amount of things you could do with video and the workbench >desktop are staggering. The ST up to date, stop making me laugh! The ST audio >is shite, too.

AGA in A1000? ECS in A1000, Workbench is excellent. But again, this thread isn't intended by me to cover current hardware mods and OS updates that don't work in the A1000. The A1000 can be in a 1985 state. Like my 520ST. Therefore to handle the graphical load you need to upgrade the A1000 memory like the 520ST. Similar state to compare by. Any other hardware mods that work are a bonus for perhaps another thread that I may start:-).

The Thread is 520ST TOS 1.0 Rules.

And Amiga's 8-bit audio is still
<snip>
viable. (took 14 bloody years, though!)

Clearly no
other computer from 1985 has survived the test. When purchasing >> a computer that won't be obsolete, the ST has proven that the life span of >> a computer is not 2 years, but that it is 15 years and more.

<snip> child like taunting eliminated.

>Go study up on the Amiga.

Boy you got me;-). Turn on the TV. If you are really, really really really, lucky, you may catch a documentary with some excellent animations on the history channel created with the Amiga in 1993-5. However, these were done without the help of the A1000 which existed roughly 10years prior. A number of objects were still created with cyber sculpt on the 520ST listed above as well as a Mega4. Regardless I am long removed from Industrial video. It was fun from 1985 to 1995. Btw, I do have a large collection of animations on video tape created on the ST from 1985 to 1990 that are excellent in concept yet clearly lacking in both resolution and colour by todays standards. The ST didnot slow down when the animation got complex. Even the A3000 running the same animation slowed down as more objects appeared on the screen. It no longer became a factor as we went from realtime animations to single frame recording. But yeah, I have forgotten alot. I tried to get away from computers (and was totally successful) for 3 years. Fell off the wagon again. Regardless, there are a number of commercials that we did the animations for that are seen on Canadian television and there is no ST involvement, if that makes you feel better. Perhaps you might study up on the ST if you are posting in an ST NG. I do need to study up, but only to remember what I have forgotten. I still have all my Amiga software manuals, at least they weren't stolen.

> Where are the expensive
Macs of yesterday, today? While once considered the >> leading edge, clearly all Expensive macs have proven that you have merely >> flushed your money down the toilet. >

>For once, I agree.

For once? You have only replied to a 4 line comment I made on the A1000. And have an opinion on the ST. But I am happy you agree nonetheless.

>> IBMPC compatibles of the same era are long gone into the bit bucket. Not
>> capable of anything then, today they merely show up in the technological
>> waste bin. >

>I totally agree.

hmm, you agree with me on mac, and on ibm, but not with the A1000. You seem to trust my statements on the other platforms. What if I was just as inacurate with their platforms. I can truly state I have had a tonne of more use out of the Amigas and the Ataris.

>Amiga? Strange but true the 1000
Amiga was both expensive and rough around the edges. Long an Atari adversary, the amiga was a failure in its early incarnation and early users paid a hefty price for that 256 k machine. >

>Bollocks! The Amiga
1000 was half the price of your comparable 80286 IBM PC. >where the hell
are you getting your figures: Drunk-Accountants-r-us? The >fucking thing
may have cost more than the Atari ShiT,

I don't have any figures or they would have been posted. However you have
supported the statement that the Amiga was more expensive than the Atari.
Regardless I still have the invoices for my A500 and My 520ST. And the A500
was alot cheaper than the A1000.

but the Amiga had >multiple
processors which were specially designed.

There you go again. I think you mean to say something else. However we know
the Amigas hardware technology was excellent.

> The ST, like Mac and IBM, were made with generic hardware.

Actually that is pretty close to the truth. The ST is pretty much off the
shelf parts. The whole package works very well together.

>> How could one ever complain of a computer where you can get NEW
software 15 years after it release. This software allows for all the
modern uses that >> they current platforms demand.

<snip> mild sarcasm,

? The Amiga is in the same boat as the ST in this
regard.

Good then. Since I don't have an A1000 and was thinking of getting one very
shortly, I will be happy to know that the current Amiga software and
internet packages will work with it. Please email me a minimum spec
required for the A1000. I have heard there are a couple of good packages.
Which one do you use?

My god, people still write games for the Atari 2600! >

Yes, clearly happy, sick individuals. However I can't seem to use Pong over
the internet with it:-).

>> >>
Clearly computers 2 years old are having difficulty running the latest >>
software for their OS, resulting in forced obsolescence of computers with
>> superior hardware and processing power to the ST. >

>Uh-huh. And I
have three testicles. Want one? Remember, society is built on >the
acquisition of money.

Well, I want to keep my money and not always buy the latest hardware just to keep up with MS. After 15 years of computing I am more interested in older machines that can operate satisfactorily in todays environment.
By the way, that third testicle could make you a film star.

This is why people are engineering this stuff so
>people upgrade.

really?

> >hahahahahahahahahaha!
! And the ST does not pre-emptively multitask.

Well thanks for informing me of this. Perhaps you need to study up on the ST if you are going to post here. Both Magic and Mint are premptive as is N.aes and Multi-TOS. All of which will work on the 1985 ST. And if you don't understand, they run the Atari Software. Not like Linux or OS9 etc. But yes, this is found on the Amigas of 1985 but not the DOS/ibm and Macs of yesteryear.

> Like the Mac, Win
3.x/95/98, and so on, the ST co-operatively multitasks. In other >words, it doesn't multitask.

Actually Geneva is co-operative and works pretty good.

What the hell is this Magic rubbish anyway? A
>replacement OS for the ST which won't run current ST software? >

Close, premptive multi tasking OS that DOES run ST software. Especially current ST software which takes full advantage of its newer features. We won't even discuss MINT.

>STOP THE BLOODY YELLING YOU TWIT!

Well, you have agreed with this "Twit" on more than one occasion.

. And more Amigas got
into top-secret US installations than STs.

Yes, Clifford SToll must have been after German Amiga users. If this is something to be proud of. I better read his book again. My memory seems to remember something about ST. I didn't know that using a computer to get into military installations was a top priority for a user today. Security is also alot tighter than 10 years ago.

Yeah yeah, the ST of 1985 had

color. So >did the Amiga. So did the PC, for whatever that was worth.
Big frigging >deal.

The mac didn't:-). Sorry its part of the argument. Yes CGA colour was awesome and is excellent to use for a web browser today. Just because the A1000 has a feature the others don't doesn't make the argument for the Atari any weaker.

God, stop being an imbecile! "Other computers from
this era CAN'T DO IT >PERIOD" is a load of rubbish. The Amiga certainly had 16 colors.

Yes it did, and you are going to give me the information on the Web browser that I can use for it. Hopefully with more than 16 colours.

Jeez louise, >the Amiga of the time did 4096 colors at
once! Your ST couldn't get ANYWHERE >NEAR THAT!

I believe I can get very close to that. Especially today. However if you had ask me that 10 years ago, I would have stopped at 512Real and 3500 simulated. But really I can surpass that. And with my STe stomp it. However If the web browser operates in 4096 colours on the A1000 I will be really blown away.

> I may be slightly
ignorant on the ST, but you are way off your >rocker in terms of comparing the Amiga to the ST...

No I am not. I am comparing a 520ST to the A1000. Where I am lacking in knowledge is any developments after 1995. You are not slightly ignorant, but simply ignorant. It is not an insult, you only know what you have heard.

>Go get a date. You need one worse than I do. > >> >>

What did I do to deserve that? Thankfully I am back to computers and motorcycle racing which are the things I truly enjoy and am no longer in need of a clingon nagging everything I do until I stop doing it. Its good to be back.

>>Today a 520ST is the CHEAPEST internet

>ever used.

I have never heard that before, even from my many former Amiga using friends who realized just how friendly the STs operating system was. There is nothing backwards about it. I really think you are just yacking off the top of your head. There are alot of things you could pick out in the ST TOS 1.0/GEM that were very unrefined. But the ST interface is anything but backward. Perhaps you never used the Amigas when something as simple as a file selector was a luxury. Regardless this would have had little effect on how I view an A1000. Which seems to be more of a concern for you than actually what the ST is capable of.

>   Even the Mac was easier to use.

Well you are into another platform and actually made an accurate statement if one is comparing the early Atari GEM to something like System 6. I used a Mac emulator on and off for a few years and it was definitely easy to use and more complete than Digital Researchs GUI.

<SNIP> Long posting cut, nothing of value found simply insults.

. Things simply to off topic to reply to.

While supporting the strengths of the Amiga platform, which was/is an excellent piece of architecture, there is really no evidence provided that I can use the A1000 for the same functions that I am currently using the 520ST for or that the new Amiga software programs will work with it.

Later Brian.

You are correct. Although the intent of the posting was to provide three distinct functions.

1) Give James Haslam something Atari to read about, since he is tired of Sinclaps Mac Postings. (Is this Atari oriented enough for you:-).

2) Since James uses a Falcon (which I also recently purchased), I thought I would post my uses with the 520ST that I purchased 15 years ago. Since I set it up on the internet in 1997 on a bet that it couldn't do PPP/PAP and that its web browser CAB didn't work, it just happened to turn out that it worked so well for me that I haven't had a need to change it. It was a pleasant surprise. And since my brother in law runs an internet providing service he was totally impressed with the ability of the 8mhz machine. Unfortuneately he doesn't live close enough to me to use his IP Service. There are alot of ST users who read the posts in comp.sys.atari.st however much of the focus is on Mint/Magic/Hades/Milan/Falcons and TTs and the ST is often overlooked. However we are all their using our STs just the same. While one of the benefits with CAB is its ability to Censor the ADs, Falcon/TT and other users may not see the advantage gained of this feature. Alot of Ads are stupid Gif Animations that take longer on a STock ST to process. They don't add anything to the web page and the Censor feature which pulls up a Gif Pic is a better solution than turning the graphics off. This feature has impressed my non Atari using friends and they would love to see this. However things like this make using an ST all the more easier on the internet.

3)Draw Sinclap out of his Mac shell for a moment and actually read something about Ataris rather than preach to us about Apple computers and IMACs. Since this has been successful, finding anyone else is even reading comp.sys.atari.advocacy is just a bonus.

>It is not enthusiasm when you run around blindly criticising
other computer brand without having a proper knowledge of them. If you do know the competing brands and lie or not specify certain information, it

makes you look like a real gastropod (slug).

I have yet to see A 286/macplus or A1000 do a better job. Both the Mac and the A1000 are capable as the ST is. However If the software isn't there, then there is little wrong with the comparision. Ironically ICAB has come out for the Mac. While I think it offers little for the PowerMac users there apparantly will be a 68*00 version to follow.

>You were mostly right about the Mac, tho.

Yup, and wrong about the Amiga, I understand fully now.

>The facts are the facts. Well, you've omitted or lied on a couple of
>them - hopefully out of ignorance and not out of sheer deception. I don't
>like deception, you see...

I read your previous post. You uncovered no deception. All of your counter arguments regarding the ST were incorrect. All your Amiga arguments cover a broad time period. And you fully agree with both my Mac and Ibm comments. So clearly you believe that I am simply lying about the Amiga. I think not. I also think many mac users will claim I am lying about the ST and wrong about the mac as well. I have no need to claim deception for a computer that can be had for under $20 today.

  > > >> I would be suprised if you used an ST

>because of greater color depths. And that's a fact. > >Define
>outrageous!

Amiga 500= 1987. That is two years after the 520ST. They are not part of the equation. They are not using kickstart 1.2 and workbench 1.2 either I am sure. And if they are thats ok. The 520ST is doing it with that very first really crappy TOS that you so humbly described.

> I can only think of two possible answers to your rude
>reply. Well, when you make a rude post, do you expect candy and roses?!

I think you are most offended. And there simply wasn't anything in the post against amiga. No one is coming to defend the DOS based ATs. His comments are based on the use of my Atari ST not other older computers.

 >Takes one to know one and you've definitely shown ignorance,

>unless you lied and I've said I don't like people who attempt to deceive
>in order to improve their own status..

What on earth are your talking about?

,
> >Well, I currently have a PeeCee clone and BeOS, WinNT 4,
>Linux (which I don't >use since it's crap), and OS/2 4. I also have an
>Amiga 500 and 3000.

Linux is crap? Hey, I don't know anything about that, but I hope you don't get something else going with that one. Since you own both an A500 and an A3000 which were the first two Amigas that I owned you should know exactly what I am talking about. The 3000 is the first working Amiga. I certainly prefer it stock to my TT. However the software makes all the difference at this stage. And it is here that the two computers really diverge.

>I nearly
>bought an Atari ST -- and then I saw the Amiga... bloody glad I didn't
>buy the ST.

Gee, I bought an A500. Bloody wish I hadn't. Luckily there were a tonne of pimply faced kids that wanted it.

> , Therefore you are most likely
>a NON INTEL user. You'd better be right in your guesses!

You and I know I am right. So does he as its in his header:-). There is no guessing. Just a chance he might be using MAGIC with his MAC.

>You're
>definitely wrong about me since you think that just because I own and use
>a PC with Windows NT on it that I'm totally ignorant of everything else
>that time has presented.

How, could I be wrong. THis is my first reply to you. I am writing both reply postings to your messages at the same time. You may use a PC but you are an Amiga user. What a surprise. So am I:-).

Therefore you are a Mac user with limited knowledge. >

>Possible. You did
>make the biggest attacks on the Mac. And I must admit, I'm not fond of
>the Mac...

I actually like all computers. I would like to run MagicMac as well.
If you knew just how much more powerful the PCs are for Animations its truly hard to fathom how advanced they have become. You can pretty much

ignore the OS and just use the brute horsepower and all the updated Amiga
programs that have been ported and updated.

>You'll get a lot more rude posts. Not by me. I've had all I need to say
>regarding this, unless you make a really good response to all this!

Yes, you said enough to the point where you had nothing to say and kept
saying nothing. However, perhaps you misunderstood the posting and a
second read will help.

No need to reply.

Later Brian.

Yup, I've had A500, A3000, and a couple A4000. Regardless Ron, what would I
need to get an A1000 on the internet with a Graphical Web browser, Similar
or Superior to CAB as I know some of them are. All my Amigas were stolen
long before we had internet access. (They never took the ST, which makes it
even more better:-).

I have come across one and would like all my computers internet friendly.
Then if I could run masquerading through my TT, I could have alot of fun.

Invest? Since when is a computer ever an investment? At best you can use it for work and write it off, (not always). It depreciates rapidly and therefore as with any tool it must have some productive benefit that either saves or makes money. On the other side the computer is just a toy. The end result is not an investment but rather sunk costs. The cost of an ST today is roughly $20. to $50. Hardly what one would term and investment. And simply a sunk cost that most anyone can afford. The benefits are a social comunity that even tolerates the likes of you:-).

But if one is considering the computer as an investment, well mine works just fine after 15 years. And it has adapted to the changes to the internet quite well. In another year or two this may not be the case as more and more Websites become Java oriented. Then a change may be necessary.

But I can say that my next new computer purchase won't be anything that has been promoted in his NG by you.

Read the post the point is clear. Is there any NEW software for the Mac
Plus that I can buy in one of your many suggested retail outlets? Since we
have had this discussion before I will let it rest with fact that there
isn't any internet/webbrowser for the Macplus.

>Ask GateWay...The question is can you buy a TOS PPC laptop today ?

Whats a TOS PPC Laptop have to do with a 1985 purchase? The thread is 520ST
TOS 1.0 rules.

As per the posting last year the rules are the same.

>My PowerBook G3 eats anything you use today...The Jihads are force to use the
>old 8 bit apps today because near zero development exists today..

Looking for 8 bits apps for 16 and 32 bit machines can be found at:

http://www.iamidiot.com/tifkas/8bitapps.html

>
>So why have many upgraded to TT, Falcon Wintel and Mac today? I bet many of
>the Jihads do not use their 520 ST today...Get Real!

Based on the number of ST users lurking, and the fact that I am using mine
I would say there is a good proportion of Atari ST users left especially
after I saw my email flood with replys from ST users and from those who
want to get their STs on the internet and didn't know it was possible.
Based on the number of posts in comp.sys.atari.st of users who have pick up
second hand STs and simply need to learn how to use them, it is not long
before I am emailed on what is needed to hook an ST up to the internet.
The main reason for this is because the 15 year old computer can get on the

internet without even the need to upgrade from the first TOS 1.0. Many emails I receive are also from former ST users who left the Atari scene nearly 8-10 years ago. They have now gone through 3 or 4 computers since then, check back to their atari roots and want to come back and see what the new software is like. Then they want to link them to a PC and use IP maquerading and have two computers on the internet. Many have old STs in closets that they pull back out. They find it takes little effort to get a PPP connection with the ST and then some just want to do some hardware hacks to STs to improve their performance. Its just a fun toy.

1) They are using STs because:
   A) They bought them new and still use them
   B) They bought them Second hand (very cheap) and want to use them
   C) They received them via donations and want to use them
   D) All current software works on the ST.

2) They are using Falcons/TTs

   A) They bought them new and use them
   B) Bought them second hand and use them
   C) The user base isn't as large for TT/Falcon and there weren't as many machines as the ST, so finding them first is difficult.

Short of the colour there isn't alot of difference in speed on the internet between my Falcon/TT/ST using a 33K modem with STing. There isn't alot of difference against my neighbors P166 either. However, hook up a cablemodem and things change rapidly.

Get real yourself. This is the whole point of the thread.

3) The go to Wintel to play Quake series.

More puzzling is why do we leave and come back?
Even more puzzling is why do you linger around here?

>For once, I agree. The Mac really hasn't

That is a PC using Amiga Jihad, just to be clear TIFKAS.

>Running the 15 year old Apps today...Yep..

No, running NEW APPS on a 15 year old computer. If you are not going to read the thread clearly, why do you even bother to reply?

> >> >Well, duh. The iMac is
the same 8 year old crap but with a newer CPU and in a >> >pretty case.
Apple ran out of ideas for selling the same old same-old... :-)

>> >The
problem with cults is, the insane leader manages to take his desciples and
>> >lead them into mass-suicide. > >Jealous? > >> The iMac has a pretty
new architecture.

If you wish to reply to an Amiga/PC user, I suggest you take it out of
comp.sys.atari.advocacy Nobody here cares about the Imac when the thread
is clearly 520ST TOS 1.0 rules. Perhaps you lost the thread. But I will not
have you taking a position against a newly sworn enemy of mine and then
throw in your own mac drivel. In this case the enemy of my enemy is not my
friend:-). Just because an Amiga.PC user can't follow the topic doesn't
mean you must stray as well. If you don't want to talk about 520STs in
Atari Advocacy I suggest you take off instead of get real.

later Brian.

>your case here.

Actually, I expect quite alot from my ST. As a platform the entire Atari/clone set up is inferior to anything on most any platform as an internet computer. I can certainly get more out of my ST on the internet then many users do.

> Now, what I found laughable is the fact that you try to apply YOUR
>reality to the world at large.

No I apply it to comp.sys.atari.advocacy which in my humble opinion is not the hotbed of computing activity. My reality is new atari software run on an old atari st that clearly operates as advertised. Laughable may be the case, but I have laughably been setting up used Megas and STs with freeware STing/NEWsie/CAB/Frac/TElstar for users who would rather spend $50 or less (Donation) than $1000 for a new computer. If you already own an Atari, what is the big deal about installing freeware and surfing the net. Perhaps there is that game you can't play with everyone. Computer envy has always existed and continues to exist as PC users play "keep up with the Jones", amongst one another. Finding that level of contentment is a fine art, especially as technology moves forward. Envy works both ways. I need not go into details here.

> Most people won't put up with bad
>performance, tricky installations, etc. You've got to wake up and
>realize the computing world has changed, and it's been a while since
>that happened.

Actually I am a returnee to the Atari Scene. My ST pretty sat idle since

1992.

"the computing world has changed, and it's been a while since that happened".

Is that statement meant to be joke?

> It would've been far more interesting if you had written a report
>about your ST and how you can get by with it on the internet, but all
>you did was deny the fact that there are cheap machines these days that
>can do the same job, only far better.

Actually I thought the same. But there isn't much to it. You have the same abilities as a Falcon or TT except without as much colour. You can make your ST faster by modifying the serial port. However mine isn't modified. I compare it with my Falcon/TT/ and my nephews P233. Most differences are in graphics. All features are available in CAB to turn off background image so as to keep a cleaner look. WEB pages look no different then when using a publishing program. NVDI adds the nice outline fonts. Otherwise you go with Gem bitmapped system fonts if you want to save memory. However most of the information for using an ST on the internet is in the FAQs and help is on comp.sys.atari.ST. As I just recently compared the ST to my Falcon and my TT setup on comp.sys.atari.st the same day as I posted here, I see little reason for duplication.

You find me a P150 for $50 or less and I will be happy. There is no insinuation that an ST can what a current computer can do. You know this is true, even from my 1st and 2nd posting to you.

>

>>
>
> Well, I do have a "more powerful" Atari than you do, but barelyt :) I
>got a 1040STe... I know fully what it can do, and what it can't.

Well, lets not waste time. If you want me to help you get it connected to the internet just for funs sake, I be willing to help. The reality is that if you are using a computer that is superior to the ST for the internet, it is less likely you would use the ST. However, I find when you use an ST and have no other computer for the internet, it delays the inevitable. Time to really have fun and turn it into a hack machine. I have an STe as well. I get a kick out of its photochrome displays of 24bit files. Other than some of my files are as large as 800 k from a 97kjpg, the author of the program was just brilliant.

> Wow, almost there, Sherlock :) But I guess that checking the headers
>gave you a better hint :P

Never overlook the obvious, but never assume either. Perhaps it was just a lucky guess:-).

> Anyway, I am a Mac user indeed, got 3 of'em, and I do have some sort
>of knowleadge about Ataris, and assorted platforms (Amiga including).

To put part of your argument in perspective, the PC domination on the internet is so strong that in many ways the MAC is the inferior product for the internet. Therefore as is done elsewhere, there are articles on getting by on the internet with a Mac. Many internet mags don't even acknowledge the Mac.

> What bets?
> Just because YOU can get on the internet doesn't mean what you see
>and use is what most people would. I wouldn't settle for a 16 colour,
>lo-res screen. You do. See?

Agreed. However it kicks butt of 386s and 486s depending on software. I look at the web page in hi res. If I go beyond the scope of this thread, I had my STe connected to via midi comm and converted the web page pics on the fly via gemview/photochrome thus taking advantage of the STe. However one could use Photochrome in ST mode to stay within the scope of 1985.

> Mind you, I can get my Commodore on the internet, with a shell
>account and a 2400bps modem. Will I win any bets? Of course. No one
>would think an old 8 bit computer can connect on the internet.

I hope you wouldn't win any bets. I used to access the internet long distance with a university terminal account AGES ago. Like everyone did then. However, get your Commodore on with PPP/PAP and you might get something. Infact I believe when I did this thread last year, there was a webpage designer and an offline browser being developed for the C64.

>But is
>doing so practical, and USEFUL for me, or the majority of people? I
>don't think so...

Actually it is pretty practical for alot of people. Using an Atari/Amiga/Mac combined userbase has never encompassed the majority of people. What you are saying is that while you have been hanging out in motorola heaven, you really want the best mostpowerful internet computer used by the majority of people. Clearly you will settle for less as you are using a Mac. However when you are ready for a real computer the PIIIs should really change how things are done.

>
> I am not rude. I was just truly gobsmacked at your post.

I can understand that. I take your word for it.

>I couldn't
>believe how far detached from reality some people can be these days.

Hardly detached from reality. It is all fact. I posted in that manner to create some sort of reaction. It was very successful. It has created discussion. The only thing you really can't believe is that the Atari ST can be used quite well as an internet computer. I have posted the same information before in a less dramatic fashion.

The bottom line is that if one accepts the TT or Falcon as an acceptable internet computer, then the ST can also be accepted. If the TT and Falcon are not considered acceptable (which creates a stir) then neither is the ST or any Amiga/486 or P150 and under. I happen to list all the above as minimum requirements for the internet. Just as our IP lists minimum specs.

If one then accepts the ST as an internet computer, then what other computer built in 1985 is on the internet with PPP/PAP and a graphical web browser and doing it with its very first version of its OS?

Now just to throw a wrench into the works, as far as I am aware the Atari 8bit has a Telnet BBs package available and the AtariST doesn'T? Correct me if I am wrong here. I just caught the end of doctor clu thread in comp.sys.atari.st.

Finally if you assumed their were comparisions between the ST and current computers, this is the result of Sinclaps need to associate the Imac against the ST whenever he needs a moral victory. I think this is just as foolish as someone believing that my post is intended to compare an ST to a modern computer.

I do tend to compare certain functions of my ST against my Falcon, TT and my Nephews Pentium. But none of this was part of the original 520ST TOS 1.0 rules post.

Hope thats clear enough.

Later Brian.

But if this makes you feel better you can see that Bengy has an iMac.
Of course he is running a superior OS on it;-).

And to go full circle this same Magic OS works with the very first ST made.
And it is easily the best upgrade my ST ever got since it received the very
first version of Calamus 1.09n.

Later Brian.

Hi Clockmeister

This probably clears up some confusion for multi processors mentioned
earlier. However such items will not exist in an A1000. Which is where my
thread contained the only mention of Amiga.

>Amiga's already have 060/PPC and soon will have G3/G4. Both can be used
>simultaneously from what I understand, so dual processing is available on
>Amiga's if what I understand is correct.

:-) Touche. Some have Multi Syncs, however.

>
>
>A flicker fixer, or better still a graphics card fixes that. Maybe I'll get
>that Voodoo addon that is in production as of now...

I remember trying this on the A500. Thank heaven for the A3000. Propage
brought tears to my eyes at the time, but it wasn't a bad program. One of

the first programs with colour separation. I used it to make product cardboard boxes.

<snip desktops/Workbench> Nice touch but I prefer to keep the Amiga/Atari battles back in the early days:-).

>And with Amiga there are no arguements over which OS is better for the
>Amiga, unlike some of the BS i've seen in c.s.a.st.

Well, thats one thing. All STs have TOS. Mint will always be around as its free. Magic will last as long as ASH remains solvent. Both run TOS based software. I also use Geneva. I like all the programs and view them as I do any other piece of software. You view it as BS, I view it as fun reading.

>
>The Yamaha chip was a relic from the 8 bit days. It in no way was
>comparable to the Paula chip.

Sound was brought into the thread by an Amiga user. It in no way reflects the original thread. Other than each Amiga owner will state and restate the obvious. Just as a Falcon and previous Amiga owner will state the obvious of the superior Falcon Sound. The Amiga was a small (very small) part of the original post. The A1000 simply had some failings. Compare it to the A2000 which is truly a workhorse. Although by todays standards, accelrators and all it is long in tooth.

>
>A hardware hack?. How was the Amiga less of an industrial design then say a
>Mac or ST?. And I might add, the Amiga didn't have a 40% failure rate out
>of the box, unlike early ST's.
>Not to mention the fact that the ST was virtually unexpandable, and had all
>it's chips (except ROMs) soldered in. That reeks of cheap and nasty.

Perhaps hardware hack is meant in the fondest terms of when a hacker was someone with talent. And the Amiga is more creative than the ST design by far. There is No such thing as a 40% failure rate for early STs. That would have meant roughly 50000 toast STs in the first year. Wild accusation that must be embedded in Amiga Myth. Actually have 5 early 520ST with external disk drives, I would be willing to challenge if they used any solder:-). Clearly I have two broken ones:-). Nope. But the Gluechip and roms are generally loose. Virtually unexpandable but not impossible.

The A1000 is expandable, what can I get for it?
The A 500 memory upgrade was easier, but everything was just as tricky as the ST to upgrade. And many upgrades were similar between the two. The FAQ clearly mentions many ST mods as does the Udoit pages listed in this thread.

>What, a hacked CP/M/GUI/68K/DOS kludge is better then an OS specifically
>written to work 100% with the hardware?. Get real.

Actually that is exactly what it is. It was rushed together. The story of the creation of the ST is just as fascinating from a drawing board to production story.

Amiga OS clearly wasn't ready even when the A500 was released. It was awful. It simply took time to get it right. The ST on the other hand was ready, but it just wasn't finished:-). There is a difference. 12 years after owning my first A500, I still start to burn with anger. I hated it, and it hated me as it spent alot of time being repaired. If you want to talk about high failure rates, look no futher than the A500. Piece of shit.

>>

>Better check your Das Boot sources too.

I would be surprised if test to speech for the Atari ST was used. Amiga Text to speech was excellent. The STs sucked because of the Yamahas limitations. This doesn't mean the sound wasn't created on an ST, I just doubt that text to speech was used via the Yamaha sound chip. I would be willing to be they used a sampler instead or maybe captured text to speech off the Amiga:-).
>
>The Amiga is far better supported, with more addons then you can poke a
>stick at.

Some are better supported than others. Not all amigas are created equal.

>Now that is just plain BS. Amigas are still being used for professional
>quality video, art and sound production, as they have always been used for.

This has changed so drastically it is hard to comprehend. Really on the diehards are left as the writing has been on the wall for quite sometime. The other problem is the superiority of the PC for professional quality video. The Amiga can do it as it always has, with some excellent tools, but it just isn't the same anymore. There is too far to go to catch up.

>Most Atari's where used for games also, and in any case, the creative use
>of Amigas is well documented.

??? Ataris were regionally based uses. Amigas were used for games and video. Nothing more, nothing less. What it did it did excellently. Other areas were severly lacking and never did come to fruitition. That is why the ST was always around. Of course up until the mid 1990s there was no way a PC would be used by us it was just garbage. Ataris never caught on in NA. They were games machines in Britain. And in the rest of europe they were treated like a real work computer.

Anyways, Take it easy. I feel like fooling around with a A1000 now. I don't think I will move to the modern Amigas. Nor would I be in line for a Hades or Milan. I gone to retro:-). I find that these supercomputer PCs which really are awesome, just bore the crap out of me.

Later Brian.

Depends how much effort you put into POV-ray! Bryce is nice (I've used a
demo on a PowerMac 7220/200), but POV-ray fits my bank-balance a little
better! :)

Bryce is quite quick (if you can call ANY rendering software that!) I do
admit, but for sheer value-for-money get POV-ray (free) and something
like EB-model (shareware?) for Atari and you can't go wrong to begin
with. Then you can move to Neon3d (if you've a Falcon) or Inshape...

Regards,

Chris Wilkinson,
/|\ ATARI Falcon030.

PS.I won't be doing ANY rendering for a while as my IDE drive has gone
kaphut! Typical !%$@#$^ cheap PC hardware!!! :-/

I have the following for sale. I prefer to sell the whole lot as a package.
However, I am willing to sell individual items but the ST must sell as a unit
and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE: $200.00 + $15.00 S&H
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, l,
manual, System & language disks, and mouse cleaning ball.

GAMES: $5.00 each + $5.00 S&H
GBA Championship Basketball The Sentry
MetroCross Star Glider
Star Ray Shadow of theBeast II
Guild of Thieves Golden Path
AD&D Hillsfar Gold Runner II
Station Fall Grid Iron
The Black Cauldron Flight Simulator II
Battleship
Pirates of the Barbary Coast

APPLICATIONS: $7.00 each + $5.00 S&H
Habba Check Minder H&D Base Hippo Pixel
Hippo Fonts Cyber Sculpt Art & Film Director
Multi Desk Calamus Outline Art OutBurst 3.3
VIP Professional Flash That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

ENTIRE PACKAGE: $250.00 +$20.00 S&H
BTW, I am not leaving the Atari scene.

I took mine out the cupboard and started playing around a bit.....
Guess what ?

Connect a CD WRITER to a 520ST, load CD Writer Pro and start writing your CD's,
no "buffer underrun" errors encountered....

I would say that not only it is the sportscar of computing, but also the F1 in
computing....

Cheers from Belgium

Dennis

Hi Dennis,
Well If it can be done on an iMac, its not as simple as on an ST.
Are there even any USB CD Writers in existance yet? If not, and
if one is lucky enough to have a Revision A or B imac, you can
get a SCSI card for it. Only prob here is that the installation
of the card is suppose to be*very* tricky, and as I said, only
the first imacs can use it.
It should be said that I didnt buy this iMac, we had a flood in
our basement and lost some computer equipment. Insurance wanted
to buy us PC replacements, I said no, so well, to make a long

story short I ended up with this. ..
I actually wanted a Milan, but thats another story..

But what other 15 year old computer can offer you 24bit graphics, 16 bit
sound and G3/G4 performance?. Still a bit of life left in the old beast.
Granted, the A1000 had some failings, but the early ST's weren't any
better. Their failngs just differed.

that
> must be embedded in Amiga Myth.

40% was quoted by an Atari dealer. Most dealers tested their stock before
sale, so customers never saw that high a failure rate.

 Actually have 5 early 520ST with external
> disk drives, I would be willing to challenge if they used any solder:-).
> Clearly I have two broken ones:-). Nope. But the Gluechip and roms are

Of all the 520's I have owned, none had socketed chips. (apart from ROMs
ofcourse)

> The A1000 is expandable, what can I get for it?

Accellerators, digitizers, RAM expansion, Harddrives, PC hardware
emulation, Zorro expanders, etc.

> The A 500 memory upgrade was easier, but everything was just as tricky as
> the ST to upgrade.

What's so hard about plugging something onto the expansion port?.
The A500 didn't just have the trapdoor expansion, both the A1000 and A500

had a expansion port.

 And many upgrades were similar between the two. The FAQ
> clearly mentions many ST mods as does the Udoit pages listed in this

shit.
>
Perhaps yours was a lemon.... ;-)
My A500 has never had a problem, except for a leaky trapdoor RAM expansion
RTC battery, which is a common problem with any computer over 5 years of
age.

The latter I believe.

The A600 is poorly supported (deservedly so, it's crap), but I can't think
of any other Amiga model that didn't have a good variety of hardware
expansion. Sure, some hardware limitations of the old Amigas (A500, A1000)
meant that they couldn't be expanded beyond a certain limit. If you wanted
expandibility, you bought a big-box Amiga. That is a nice option to have
;-)

For the extra level of functionality that you get with a PC, the added
expense is usually the prohibitive factor. PC's have only just overtaken in
this field, and not due to quality but speed.

VRAM.

Sure. Check the specs on the upcoming G3/G4 Amiga upgrade boards from Escena, Phase V or the AmiJoe for some interesting developments also on the other side of the fence.

New Icons and Magic WB are simply enhancements which don't affect the operation of Workbench in any real terms. Some Amigans don't like MUI because of the extra overhead, but I personally can't see what the fuss is about. It's rather excellent as a programming aid.
OS3.5 will sort out these issues in any case.

True, unless you add a sound card ofcourse ;-)

>   Catch ya later... ;-)
>

No doubt! :-)

At least where all still here to argue over which is better, an arguement no-one is expected to win ;-)

:-^

Amiga Inc. is now a subsidary of Gateway, has new machines in development, is co-producing an OS upgrade (3.5) and therefore still supporting "classic" Amigas.

Corel has just announced that they will support the new Amiga, as have the Bitmap brothers, and Adobe is rumoured to have taken a serious interest in obtaining developer machines.

Last I heard, there was zero chance of Atari Corp making a comeback, which is ofcourse rather unfortunate as the combination of shithot Amiga and Atari machines would most likely impact Apple sales to the point where even Microsoft couldn't bail them out.

Nevertheless, NG Amiga sales alone will probably achieve that result.

About 2c worth...

Last I heard, Gateway decided to not go through with a new Amiga unless a third party developed the hardware. This news was about 2 months ago. Is Gateway acting incompetent by changing their minds every 3 seconds or have they found somebody stupid enough to develop this bull* machine I have read about? (I am pro-Amiga, but it's a shame that Amiga, Inc and Gateway are so full of *.)

>
> Corel has just announced that they will support the new Amiga, as have the

Where's the article, on the net or anywhere else? Why should we look for evidence to support *your* claim? You must give us the evidence as well, you see.

One other point. Corel and Adobe and the rest NEVER GAVE A BLOODY DAMN when Commodore had the Amiga. Why the change, now? Their respective CEOs got testicle implants thus they finally have the balls to support more than Windows?

>

Don't count your bullets until they're shot. But I do agree, anything to knock down Wintel and anything which would obliterate Apple off the face of this earth would be a very good thing, indeed. (I'm very anti-Apple.)

>
> Nevertheless, NG Amiga sales alone will probably achieve that result.

Let's wait until it comes out. Meanwhile BeOS is quite the acceptable alternative and costs a hell of a lot less than QNX or whatever rubbish OS the NG Amiga will have...

AmigaOS 3.5 is a farce, too - considering the latest system requirements and

```
what you get in return...

> About 2c worth...

True.  Amiga these days is about that much in value.  :-(  I'll stick with my
original A3000 and my emulator, thanx all the same.

It's nice to dream...I can see how this plays in the market..."Whats an
Omega?"

I hate to say it...The new Amiga what ever it is will never be a mass market
item again..

If any indications...the pricing of the new Amiga(s) will be priced out of
the stratosphere.. I just saw the latest Amazing Computing which is moving
to large print to stay afloat and fill pages had ads for 060 Amiga clones at
$2499...

Hi Bengy,

>Well If it can be done on an iMac, its not as simple as on an ST. Are there
>even any USB CD Writers in existance yet?
No USB CD writers for the moment, let alone drivers...

>if one is lucky enough to have a Revision A or B imac, you can get a SCSI card
>for it. Only prob here is that the installation of the card is suppose to
>be*very* tricky, and as I said, only the first imacs can use it.
Possibly, but that means doing a hardware hack, which is not what this thread is about.

>I said no, so well, to make a long story short I ended up with this. ..
>I actually wanted a Milan, but thats another story..
I was not attacking you or any iMac user for what it's worth. Because according to TiFKAS the iMac is outselling everything else and contains the latest Apple super duper technology I thought it was only fair to compare a 15 year old computer to the best Apple has to offer....

So no CD Burning, no serious MIDI applications or hardware...
I gues Brian is right....a $5 520ST with TOS 1.0 RULES!!!

Cheers from Belgium
Dennis

[Article crossposted from comp.arch,comp.sys.intel,alt.folklore.computers]
[Author was David E. Fox]
[Posted on 01 Apr 1999 07:44:58 GMT]

FOR IMMEDIATE RELEASE

Sunnyvale, CA (AP): Intel spokesmen today announced that because of an impending shortage of transistors that they would have to shut down their Pentium III fabrication line and retool their fabrication setups for earlier-generation processors, such as the 8080 and 8088.

An intel spokesman commented that these new processors use so many millions of transistors each, and with all the processors we're making, this shortage (which has been foreseen by many) is, well, inevitable. There are just simply not enough transistors to go around, and if the current rate of usage keeps at it, the world will be out of transistors by approximately June 30, 1999.

"Current generation Intel chips (Pentium III) use 5-6 million transistors per CPU. By comparison, the 8088 only needed 29,000, and the 8080 only needed a few thousand or so. Thus for us, retooling is the best solution to this problem", said one Intel company spokesman. But it only delays the inevitable.

After the announcement, Intel company stock dropped a bit, but surprisingly, valve (vacuum tube) stock was the highest it had ever been in years.

What makes a computer dead?

Well it all comes down to the user! The age old war of 'my computers better than yours' has been answered many times and doesn't take a brain surgeon to work out the answer!

Every computer has it's strong and weak points. The Amiga's strong point is that it has some nice games!

I bought the A1200 when it first came out and run it alongside a standard half meg 520STFM with a slow 120D+ printer, and running at 8Mhz the Atari left the A1200 standing.

For serious software they are more reliable than PC Windoze, but are still prone to crashing for no apparent reason. The best Amiga I've owner IS a CD32, which I still have. If only the A1200 was as accommodating:)

If you haven't worked out yet what makes a computer to die, then I'll tell you;)

It's its user base. And I can tell you that the Atari side of things is bigger than you think.

The thing that makes Atari computers stand out amongst the crowd is it's MIDI (Musical Instrument Digital Interface, if you didn't know) as STANDARD. Why copy Korg etc. when you can use the real thing.

Did you know that some of Sierra's software allowed the music in their games to be played via MIDI!!!

I get at least 5 calls a week from musicians, all have got PC's and NO Amiga. What's more they all say the same thing "The PC's MIDI timing" is useless (I can't use their exact words, I'll let you figure out the word used).

Before announcing a computer platform as DEAD you must look at the history of the platform.

I'll only be brief here, if you want any more info then use a search engine 'www.yahoo.com' is a good place to start;)

Atari 2600:
Still used. I think this was the first proper games console?

Atari 9-bits: 400, 800, 600XL, 800XL, 65XE.....
Definitely still has a BIG userbase. Not bad machines, nearly twice as fast as a C64 and with 4 channel sound and can use 16-bit sound!!!

Atari ST:
Still supported widely. Was the first computer to have MIDI as standard. Had/does have a wide user base, and can be found in recording studios and SCHOOLS. They are still being used on and in TV and films;) The STE version had hardware and improvements that let others behind.

Atari Falcon:
A 32-bit version of the ST's with added woosh. Real time audio processing and dedicated DSP processor gave it a world of it's own.

Atari Jaguar:
FIRST 64-bit console.

Atari LYNX:
First COLOUR handheld console and the only one that catered for left and right handed users.

Atari Portfolio:
First 16-bit pocket size computer.

Atari STacy:
Atari's portable ST.

There are ones I've missed, before everyone tell me so;) Although the brand name, the computer section, is owned by Hasbro the Atari as a TOS platform is STILL in production. The last one I looked into was the Hades 060.

Now before you make other silly statements, I suggest you do some homework before you employ your keyboard;)

The Atari platform is far from being dead, as it has a BIGGER user base than the Amiga. Don't forget that Atari was responsible for the Amiga, as Atari commissioned the project. Hey they come with a PSU build in, no foot warmer;)

The Atari have some brilliant bad points: STFM's sounds, the revolutionary place for the joystick and mouse ports... I can't think of any others.

Now lets come to the phrase 'deader than..'. What does this mean! How can anything be deader than another. I thought when something is dead

it's dead. Let's say my neighbour and myself both had a cat and they
both kick the bucket, now they both are dead and you can't get much
deader than dead!!!! To make that statement make sense, one has to be
dead and it definitely isn't the one I use! OR the people that have ONLY
just discovered them;)

--
Cheers! for now

Clockmeister <gerryvdb@net.com.au> wrote on 04-04-99:

>Amiga Inc. is now a subsidary of Gateway, has new machines in development,
>is co-producing an OS upgrade (3.5) and therefore still supporting
>"classic" Amigas.

I gues you still believe in Santa Claus also?
These machines are not for sale, in my book this is VAPOURWARE.

Atari TOS based OS machines are for sale right now, and there is a user base
out there buying them and using them..... I suppose these people are zombies?
Open your eyes man... Amiga Inc. is nothing more then a commodity currently
owned by Gateway, for all you know Micro$hit could be the next owner-))

So, before coming in this newsgroup and pronounce us dead, take a very good and loooong look at your own platform. The 3 piece suite guys are preparing the funeral of Amiga Inc.

The Atari community is alive and kicking, we're ready for the next century, and if all goes well Brian Van Tilborg will post a message in 2014 praising the virtues of his 30 old years 520 ST.

Atari users/owners have always been the underdog, this has made us strong, it made us stick together, and internet has strenghten this, we're in contact now with people all over the world with the same passion, we've transformed from a simple computer users group to one big happy family. If you attack one of us, you attack the whole bunch.....

And as for new software, we're doing just fine thank you, which can't be said for your platform.....didn't SoftLogic bite the dust? Oh boy no more DTP on the Amiga Platform, another one bites the dust -)))

Cheers from Belgium

Dennis

Yep, that was about 2 cents worth alright... (just kidding!) ;-))

Seriously, I was glad to see Gateway show some (non-PC) balls
and back the Amiga. Bet Gates lost some sleep after getting
reports of that! ;-)

About Atari Corp. You're right - I doubt they will ever return
and...so what? You'll find most Atarians have very mixed feelings
about them. Much like Amigans feel about Commodore. Ever heard
of the Milan? Very nice, fast '040/'060 TOS clone, that, from
all accounts, is doing very well in Europe.

Later... ;-)

Yes, there have been a few complaints, mainly from those that have
minimalist systems ;-).

Yes, there are a few now. I don't follow the soundcard market very closely
as I don't have a great deal of interest in that department. For the few
MODs that I have written, and for listening to other peoples creations,
Paula does the job pretty well.

I do know that there are sub $300 cards, from different manufacturers and
also one particularly expensive (and rare) card which is basically a
recording studio on a card.

Not yet he hasn't. Gateway and MS have had an uneasy relationship for quite
some time. (well before Gateway aquired AI)

>   About Atari Corp. You're right - I doubt they will ever return

*.)

QNX are developing the kernel (check the QNX website for more on this), and

Amiga are going to do their own hardware in conjunction with other
partners.

Amiga Inc is now combined and have relocated. Jim Collas, Gateway's
vice-president, is now head of Amiga Inc and wants results, not BS.

Everyone is sick of the AInc BS. That is the reason Jim Collas was moved to
the helm IMO.

I'll look it up. The Corel announcement was on Cnet.

If you haven't noticed, the industry is in recent years much more receptive
of "alternative" OS's. With crowds of users moving to Linux, and the sudden
interest in supposedly "dead" platforms by consumers, it is in their
interest to take notice.
One drop of rain can be the start of a flood after all...

BeOS has little support, despite being a very good OS. You may be
interested to know that BeOS was inspired by AmigaOS.
QNX is a very good OS, surely you can't dismiss it that easily?.

> AmigaOS 3.5 is a farce, too - considering the latest system requirements

I wish that was true. I can't find an A4000 under $1000 here. UAE is slow.

Amiga has made a lasting impression on a lot of people in the industry, and
a good one at that.

>
> I hate to say it...The new Amiga what ever it is will never be a mass
market
> item again..

That remains to be seen. Regardless, another alternative would be nice.
Actually, considering that the PC/Mac are only surviving on hype and BS in
the currently stale market, I give a new Amiga a half decent chance if it
too delivers on the promises.

> If any indications...the pricing of the new Amiga(s) will be priced out
of

I was referring to the new Amigas from Amiga Inc, not classic clones.
In any case, I can get an 060 upgrade (and soon G3/G4) plus graphic card

for my A2000 for much less then $2499.

You went pretty easy in your reply... I expected much worse.
I don't suppose you have a soft spot for the Amiga do you?.

Regards,

Clockmeister.

Funny. I guess the put the vice president of Gateway in charge of Amiga Inc just so he could hammer the final nails into the coffin. Just why would they be hiring all those engineers I wonder...

Can't you simply admit that Atari Corp is in a worse state then Amiga Inc?. In that sense, Atari IS deader then Amiga Inc.

> The Atari community is alive and kicking, we're ready for the next
century,

I remember hearing in those days that the Dire Straits "Money for nothing" video (the one with the "cubic" movers) was made on an ST, because they couldn't get their hands on an Amiga or a colour Mac at the time. Can anyone confirm this ? What software was it made with ?

>> manufactured after the Falcon was introduced, I think with exception
>> for some STe's. How many Amiga clones exist today? And how many
>> laptops were made?
>
>Ask GateWay...The question is can you buy a TOS PPC laptop today ?

A TOS compatible laptop you can buy but not with TOS preinstalled. TOS
supports about all architectures but needs either Unix, Windows or

MacOS to be able to run on Alpha, Intel and PPC. The point however was
that Amiga had no clones and no laptop models. Atari do.

Even you do know MacOS does not put the hardware in it's fullest use,
it's still sluggish. Also the windows platform has more apps available
than MacOS.

Please, next time only comment my writings in your replies to me. And
I too beleive Apple is to stay, it fills a niche in the market. But
still Mac's are far from perfect. Atari is perhaps limited by it's
current hardware but damned it's about perfect.

Take your time and listen to the Amiga voice syntheziser and the Atari
Text-to-speech. Compare them to the Das Boot sountrack and to the old
Techno tunes. Then judge by yourself!

well the Phenix has dual CPU's, maybe CENTEK's Falcon upgrade board
allows
for 2 CPU's, I think that Milan allows for 2 CPU's also??

ahhemm.. haven't heard of MiNT have we? how's about Linux?
co-operative OR pre-emptive multitasking with MiNT

Hi All!

This is a message to announce the opening of my own website! It's rather basic at the moment, but that's only because I'm a novice at HTML! ;-))

I used a program called Web Wizard, published by Cadenza Software for the Atari series of computers. It's a great program that enables the putting together of web pages with background images and sound files, and I think they look pretty good! ;-))

At present I have four main sections: My Homepages, My Atari Page, Atari Downloads, and a Links section; but I plan to expand these further with new sections.

The Downloads page only has two files to download, and they are Demos for the Atari Falcon, but I'm open to suggestions on what else to put on there. I only want to put Atari stuff there, and not commercial stuff neither!! :) The demos are: Sonoluminesenz by Avena, and The Lost Blubb by Lazer. These can be hard to track down on the Web, so that's why I've put them on!!

The Links section I think is pretty good, as well as Atari websites there are more general stuff there too, including a section of Online Newspapers that are around (only UK ones at the mo'!).

Whats the address, I hear you cry? Well its:

http://www.users.zetnet.co.uk/jfhaslam/index.htm

Any comments/suggestions on the site are welcome, just email to the
address below!

Cheers!

James

<timanov@www.geocities.com>

Did you ever read/hear about the ATW or the TT.

Falcon and the two above use multi processors (FPU and transputers)
The ATW even up to 8 or 12? IIRC.

MagiC is a preemtive multitasking OS, running all kind of ST software,
even some very old ones, like 1st Word Plus.
cheers

Joergen

Surfing with CAB 2.7 on a Atari Falcon 030 powered by MagiC v. 6.0.

Hehe :)

Intel should have cornered the kitchen appliance market by now too
by putting a bevelled edge around the top of the Pentium Processors,
so that the fried egg wouldn't dribble onto the motherboard!...

Regards,

Chris Wilkinson, Christchurch, New Zealand.

My pleasure!

I just enjoy taking the mickey out of M$, intel, and anything else
thats fair game in this world (like iMac!).

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

  How can you make such an idiotic statement as that? You honestly think
  that we don't have apps that multitask? Geez, are you deluded! Whats
  more, our apps do pre-emptive multitasking..not co-operative...get over
  it...!

This must be a joke. Motorola is definitely the better CPU maker, but even the 6802 was just as inferior as the 8088 (only less so, the 808x were real crap.)

I have the following for items for sale.  The only rule is that the Jag, Jag
CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 2 Power Pads, manuals, and boxes.

Cartridge Games:
Alien vs. Predator     Cybermorph        Fight for Life
Iron Soldier      Kasumi Ninja                Raiden
Rayman             Theme Park        Zool2
Trevor McFur in the Crescent Galaxy
Val d�Isere  Skiing & Snowboarding

CD Games:
Blue Lightning         Myst          Vid Grid
BTW, I am not leaving the Atari scene.

Where can I find a MagicMac demo, in english, as well as those desktop replacement things?

There is no replacement desktop for the MacOS. It goes against Apple's original plans for the Mac. And, of course, the Finder is good enough, you don't NEED a replacement, unlike TOS/GEM...

Anyway, now I recall something called Greg's Browser, which isn't a replacement per se, but it's a file browser, and it mimics the NeXTStep file browser. It's no more than a curiosity.

Yes, of course, but it's just another case of
you-get-what-you-pay-for. POV produces bland, utterly useless output,
while Bryce is getting better all the time. Version 4 produces some
truly gorgeous, realistic scenery.

No, it's not Bryce that's quick, it's your Atari that's too slow :)
Anyway, I'd like to see some URLs for those Atari 3D software,
because I fear they might not be up to snuff, at least not when compared
to what's available (sometimes cheaply) for the Mac.

Yes indeed!
```

After a lengthy hiatus, the newsgroup comp.sys.atari.announce is back. I have taken over as moderator, and just approved a posting, the group's first in years.

I plan to update the group's charter, and will work with the Atari/Usenet community to make the newsgroup as useful as it can be. c.s.a.a will be a low-volume newsgroup offering news about Atari software, hardware, Web sites, and other information relevant to Atari users. Articles may be related to Atari 8-bit, ST, Portfolio, and PC clones.

I would appreciate your help in getting the word out about comp.sys.atari.announce -- after such a long lull, I'm sure many Atari-loving newsgroup readers have forgotten about this newsgroup. Of course, I also invite folks to post any Atari-related announcements to the group.

Hi Alexandre, - just for the record, there is actually several 3D software packets
for the Atari range of computers among them is CAD3D - Cyber Sculp and Cyber
Paint, a software suite made by some of the guys that is now working at Kinetic
Software,- does 3DMAX ring a bell? Anyway,- Tom Hudson was one of the authors of
CAD3D.

Try having a look at some of the Atari ftp sites, like ftp.funet.fi/pub/atari/
or at ftp.lib6.fr/pub/atari/. Some others to, but I can`t remember of hand.

They all have demos of the above software, NEoN, InShape, Xenomorph, and the some.
But it is slow on any Atari computer that I know of, havn`t seen a Hades or a
Medusa.

I don`t think there is a demo of MagiC Mac in english, you have to settle for the
german demo. I think you can find it at ASH`s site.
http://members.aol.com/ashinfo/index.html

cheers

> Where can I find a MagicMac demo, in english, as well as those desktop replacement things?

On my page, in the demo section, you can download the german demo of MagiC Mac. Then on the same page(The demo section of the download Bay) also grab THING 1.27 E which will be your english desktop. I prefer jinnee but as you need english, thing is the only modern *english* one out right now. English jinnee coming soon though.. (Just remembered, jump to the "Rscs" section and grab the partial translation of the *mac* side of MagiC mac, it will help you a bit in setting it up)

> There is no replacement desktop for the MacOS. It goes against Apple's original plans for the Mac. And, of course, the Finder is good enough, you don't NEED a replacement, unlike TOS/GEM...

I agree that it goes against apple's original plans, an example of this is how apple is not using the "THEMES" in the newer version's of MacOS, when I believe they have great potential (ie the NotePaper theme, or whatever its called, that apple made but banned..)
Where I do NOT agree is how you seem to believe that the Finder is good enough. Compared to Thing OR jinnee it PALES greatly in comparison, both in looks and functionality. (On the looks side, the only thing that finder might have is it's support for 32bit transparent icons in 8.5, as opposed to the max 8bit ones in all atari desktops)
For Finder, one has to load in control panels and extensions to even come close to jinnee, and still it's behind..example? Well here are 2 off the top of my head..
1) Window Backgrounds? In Finder, I use a utility called WINDOW MONKEY.. nice, but..
Yep, already built right into jinnee and better intergrated I might add.
2) Under Finder, I use "FinderPop" which is a control panel/extension which allows me to click and hold down the button on the desktop or over icons to do various actions such as browse through my C: partition quickly or delete an item. Under jinnee, once again this is built right into the desktop, and once again *much* more advanced and intergrated.

There are loads of other examples but in summary, Finder lacks in many area's. Even the principle of changing icons. Find the icon you want: get information: Highlight icon box: copy: finder file you wish to assign icon to: get info: highlight icon box: paste! I mean come on, it's so primative. Ofcourse there are easier ways to do it, but only with additional add on software. I could go on and on, there's just so many small things such as this. Another one. Under MagiC one can window shade a window, Iconfy it, AND hide it. Under MacOS? Only hide and windowshade, There is no "quick way" to "minimize" the program's window.

Conclusion: Finder is not a bad desktop, but dont even try to compare or judge it against any of the MODERN atari desktops. Sure, I agree, With TOS/GEM you need a replacement desktop if you want to keep up, but come on, the GEM desktop hasnt been updated in HOW MANY years? And still it almost holds its own weight still..

> Anyway, now I recall something called Greg's Browser, which isn't a
> replacement per se, but it's a file browser, and it mimics the NeXTStep
> file browser. It's no more than a curiosity.

Yes I tried this out. On nice thing (actually quite nice) that macOS has is Kaleidascope which is truly fun and entertaining.. If any one is not familiar with it, you can download different "Schemes" such as Windows98, NeXT Step, Dracula, Halloween, whatever, and it transforms you computer to look like it. I hoped this would come to the MagiC platform in the form of winframes, since MagiC6.x people can now modify the way windows look etc, but it has yet to catch on. There are 3 "themes" for MagiC all done by the same guy in the "Theme" Section of MagiC Online.

> >
> > What low cost......hahahha. A Newer G3 400Mhz card is over $1500.00.
>
> Try $500 in the 200 MHZ+ range..

Correct...but choose your G3 card VERY CAREFULLY. I have seen a very
recent list of available G3 cards and each different card might only work on a
particular series PowerMac ie...7200 or 7220. By no means was the list of
PowerMacs that CAN accept a G3 card a full list of existing PowerMacs...

...oh well, at least when an accelerator comes out for Falcon030 you know it
WILL work on Falcon030...

> Peter S.
> PowerBook G3/266....14'', 64MB, 4G's, ethernet, 56k, S-Video out....

Sinclair P <sinclair2246@my-dejanews.com> whined about:

Hi TIFKAS, how's your head, still those pains?, well you realy got to
see a doctor soon....
>Apple never had to catch up...Constant updating

Did You say never ? When will the MAC OS be in 100% PPC code? When will
the MAC OS have a decent finder? why is it that after 4 years those
ingenious people that "think different" still haven't got it right?
Why is it that OS X, is based on a different OS? When wil the OS be
capable of preemptive multitasking, why is it that the moving sliders
were "stolen" from MagiC?

But there's hope. JINNEE 2.0 is able to launch MAC applications straight
from the desktop..... This means that for the first time ever a Mac user
will actually get to know what a real desktop is like, gone are the days
of the crummy Finder, lets go Jinnee, Lets do it the Atari way-))

YES, THE JIHAD CONSPIRACY is about to take place...first we get rid of
the crummy finder, next thing, before you know, the out of date Mac OS
is replaced by a modern and fast OS (MagiC)

>When Will TOS goto PPC?
Have you eaten your strained spinach ....?
Atari is going PPC in a couple of months, courtesy of Titan Design. These
guys are working hard on a add on card, up to 300Mhz PPC, real PPC power,
not crippled by a crummy OS

What did you say? YES, strained spinach is good against the pain in your head, a dish a day wil keep the doctor away, now that's a good boy....

Cheers from Belgium

Dennis

    I have to second that, actually - the idea of, indeed, ANY
advocacy group on USENET is for the user of said system to vigourously
defend his particular choice of computer for his home or professional
use from those who feel that THEIR system is the better one. The same
is true of .mac.advocacy and .pc.advocacy . And indeed, I find many of
```

the arguments here that are presented are usually pretty thoughtful and informative - at least I hope that mine are.

They can also, on occasion, be pretty funny, especially in TiFKAS' case because his overblown rhetoric, mindless posting of press releases and have-to-read-it-to-believe-it blowhard posturing in maintaining the Steve Jobs Reality-Distortion Field� is UNINTENTIONALLY funny :) That's where I come in, when I burst his bubble and show him up for the pathetic ignoramous he really is. If he were a TRUE Mac advocate he'd be butting heads with the PC crowd that regularly post their own flamemail in .mac.advocacy (which there are many good people there who do a great job, particulary Jayfar and Joe Ragosta); however, TiFKAS, like Wile E. Coyote, has often kept up with his pursuits while forgetting his original aim.....and usually has it explode in his face.

I'm sure TiFKAS is going to respond, probably again in a missive to his imaginary friend "Chunks" - and when he does, I'm ready for him with some interesting evidence that Ataris actually had some features the current Mac OS (8.5) is claiming that they're innovators on (I just got the latest copy of Atari Computing, Issue 12, and I'm loaded for bear , muahahahahaha!)

I'm not sure why so many in this newsgroup get so frothed up over seeing Mr. Sinclair-Day posting iMac rhubarb into this newsgroup. He is doing things by the 'book' by posting to an 'advocacy' newsgroup. I quite frankly enjoy the spirited nature of replies that often make it into here. This is one of the more 'true' advocacy newsgroups I've read.

Also, I used to often bombard comp.sys.mac.advocacy and other newsgroups with similar (but based on REAL experience I have had of BOTH platforms - Mr.Sinclair-Day obviously hasn't!). Therefore I feel it is warranted for any Mac users to do the same here...

If it irks you don't subscribe...but remember together we Jihads stand!

Regards,
Chris Wilkinson,

[Article crossposted from rec.humor.funny]
[Author was Tim Rueger]
[Posted on Tue, 23 Mar 1999 19:30:00 PST]

Intel has recently run a commercial featuring Homer Simpson. He has his brain replaced with a Pentium chip; he is then able to design an advanced "super donut".

Apple just web-posted a video in which the HAL 9000 (from 2001: A Space Odyssey) extols the the Mac's

Y2K readiness.

So it seems the choice is now: a PC with the brain
of Homer Simpson, or a Mac recommended by an insane
computer.

Now, where *did* I put that abacus...

You forgot to highlite ADVOCACY...

> It is NOT the place to post messages about iMacs or anything other than ATARI.
> I'm quite frankly getting PISSED OFF by the messages in here that don't relate
> to Atari.

comp.sys.atari.advocacy is defined by the charter as "attacking and defending
Atari"....

What do you not understand?

> Go and find another newsgroup, I'm sure there are loads of Mac newsgroups.

You go find another newsgroup if you can't take the heat...

Try this...

USB MIDI processing unit shipping
Staff Report, email@maccentral.com
March 23, 1999, 7:30 pm ET

Edirol North America -- the sales and support channel for Roland's Desktop Media Production group -- has begun shipping the Roland SMPU-64 USB/MIDI interface for iMacs and Blue G3s, according to iMacInTouch.

The SMPU-64 connects to any personal computer equipped with a USB connector. The digital connection offers "high-quality, low-noise" sound, says Edirol. The company says plug and play capability eliminates the need for the "annoying settings" required by personal computer connection (unlike ISA/PCI cards)

Power is supplied from a personal computer via the USB connector so no additional power supply is needed. Since the interface don't use serial and parallel ports, it frees up ports allowing a modem and printer to remain connected

The SMPU-64 has four MIDI Ins and four MIDI Outs that accommodate complex multitrack sequencing. There's an individual LED indicator for each MIDI In/Out port. The driver (supplied with the S-MPU64) features a Patch Bay function for utilizing S-MPU64 functions to the fullest extent. Edirol says that using a USB-equipped personal computer allows for the control of up to four S-MPU64 units at one time (64 x 4 = 256 tracks).

Retail pricing for the 64-channel device is US $250, but Edirol's site has it listed for $175.

I have the following for sale. I prefer to sell the whole lot as a package.
However, I am willing to sell individual items but the ST must sell as a unit
and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE:
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, Alpha
Data trackball, manual, System & language disks, and mouse cleaning ball.

```
GAMES:
GBA Championship Basketball The Sentry         Populous
MetroCross              Star Glider      Conquest of Camelot

Guild of Thieves             Star Ray     Shadow of the
Beast II
Zork I                  AD&D Hillsfar         Gold Runner II
Station Fall            Golden Path      Grid Iron
HitchHiker's Guide to the Galaxy  The Black Cauldron    Swiftar
Battleship               Obitus           Alcon
Pirates of the Barbary Coast     Flight Simulator II
```

APPLICATIONS:
Habba Check Minder   H&D Base   Hippo Pixel
Hippo Fonts   Cyber Sculpt   Art & Film Director
Multi Desk   Calamus Outline Art   OutBurst 3.3
VIP Professional   Flash   That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

BTW, I am not leaving the Atari scene.

Atari Enthusiasts...

This is to notify you of the recent reopening of the once-famous Atari Central message forums. Many of the original messages are still there and are now searchable. There's also a new Lynx message forum as well.

We are also currently offering an easy way for would-be Atari content providers to have material hosted at Ataricentral for free. We will also display free ads for non-profit pro-Atari ventures.

Hope you stop by. http://www.ataricentral.com

Okay, fair enough. Now here is an equally fair question. Can the first Mac released in 1984 handle it???????? C'mon lets see you give a straight and honest answer here (like yes or no?) for just once in your miserable and wretched life...!!!!

Particular Atari 8-bit game...

Yo! I'm looking for an old Atari 8-bit game.   I recall this from my awesome childhood, but I can't remember the name and I vaguely recall the plot, but if I saw the graphics I'd recall it instantly.

I do recall that the game was made by Avalon Hill, I'm certain of it. Probably. I also remember that it was outer-space related or at least had a space background... The game scrolled in several directions since the main character dude had the potential of going in any direction. I think the word "Mission" was in the title. The title displayed was in dark blue blocks forming the letters. (I think...)   I know the graphics weren't "conventional" like other games, there was a lot of palette swapping, and other unusual effects. It was an adventure game. Sound was pretty freaky, too. It had a psychedelic quality.

It's been bugging me ever since I found this cool Atari-8 emulator on the net... I can't find the game!

Wretched memory of mine, can anybody help me with this?

Thanks!

Well, the US invented the bloody internet so I'm glad somebody's spreading the word. All I can hope is that the person who's spreading is telling the truth.

>inventory...That was true in the Atari ST days....But thats nothing for iMac
>inventory..

    1) no matter how much you try to invoke him, your imaginary friend
"Chunks" does not exist. And now he's supposed to be a MAC Jihad?

    2) it's still unsold inventory, TiFKAS - and according to your
source at the National Pest, they were supposed to be "all out or hard
to get" as of its publication date of March 3rd. It's March 26th and
I'm still finding iMacs (in all five colours yet!) in a number of
stores....

>
>> >
>> >>   Computer Systems Centre (Spadina & College) - about 10 iMacs on the
floor
>> >> in boxes, all five colours. Five iMacs on display on a round table -
>> >> strangely, all facing butt-out rather than screen out.
>> >
>> >Could be the empty shell display ones..
>> >Just 10 iMacs left? Thats nothing...50 on hand would indicate slow sales..
>>
>>   that's just sitting on the floor - let's not also forget that they
>> also have stock areas in the back...
>
>And you have not finished the count. Go back and account for the units..

    nope, how about coming up with REAL sales figures for Canada -
after all, you ARE supposed to be a professional....

>
>> >
>> >Maybe a poor job in marketing and selling skills? Send then down south and
>> >will be gone in an hour..
>>
>>   ahhh, dodging the issue - according to your article there should be
>> LITTLE TO NO iMACS left at all in Canada! That includes Rev Bs. Plus, I
>> believe you were the one cackling about FutureShop carrying the iMac
>> and gloating that "they must be selling well".
>
>From what you have reported is true. There is little stocks of iMACS LEFT.

    nope, it's still PLENTY of stock. Oh, by the way:

    1) CompuCentre (the OTHER Canadian store you were gloating about
getting the iMac in Canada) has just started a sale to clear inventory.

Guess what? They have Rev. B iMacs in stock.

2) I just had an interesting conversation with my brother, the Mac repairman, tonight - he says that it's absolutely no problem getting a hold of a Rev. B, because Apple's warehouse happens to be FULL of them. AAMoF, he's told me that Apple Canada is making special offers to his store to purchase French-Canadian iMacs at a special reduced price. So much for your fairy tales about empty warehouses. (BTW, Apple DOESN'T EVEN HAVE A WAREHOUSE FOR CANADA ANYMORE - they're all shipped out from the states....)

>>
>>   too afraid to admit you made a boo-boo?
>
>Whats your definition of little to no units available? My defenition is 30
>units or less.

my definition is any inventory that can be easily found despite flawed news reports that mindlessly parroted an Apple press release that claimed "little to no iMacs can be found" dated March 3rd.

Too afraid to admit you made a boo-boo?

>>
>>   or maybe it's the fact that there's really no driver support for
>> the iMac yet - that's according to a MIDI professional I talked to at
>> TAF last week. STILL no support for the new Roland USB-to-MIDI adaptor,
>> which seems to be the major player. Or maybe they're waiting for a
>> version of Cubase (the major player for the Mac sequencer) that will
>> work with floppyless G3s (Cubase uses a key disc for the Mac - Jobs has
>> shot himself in the foot)
>
>Maybe you have looked in the wrong place...Try looking down south...for once!

Nah, you're the expert at it - you look "down south" so much you're constantly wiping the sphincter marks from your neck!

But I DO check more reliable sources than famous disinformationists like TiFKAS - like http://www.macintouch.com , which recently reported that the main players for USB/MIDI support still haven't produced yet for the iMac - and will now be APRIL before any product or drivers show. PLUS I get the Club Cubase newsletter, which still hasn't reported any progress on the Steinberg or the 3rd party parts on getting Cubase to run on iMac or the G3 Tower (I got the latest one a few days ago).

But one other thing that got me thinking - last reply you made a crack about how I should ask people to bring these products in. Well, shouldn't that be the responsibilty of Mac owners interested in these products? I guess then it's either Mac owners have given up and gone home, or that there just aren't any product for them to bring in. BTW, Long & McQuades is considered a very cutting-edge music store chain in

Canada so they would certainly get in a new product if it were
available....

50Mhz CPU, 50Mhz FPU and 50Mhz RAM access on the Centurbo 2 rev.B

When you consider that a 16Mhz Falcon running MagiC 4 or even
just plain vanilla TOS seems quite a usable system you will appreciate
that a 50Mhz acceleration of the aforementioned devices will make the
Falcon seem to fly.

Two machines reside in the house I live in currently...my 16/32Mhz Falcon
with 16Mb RAM and a 200Mhz PowerMac 7220 with 32Mb RAM.

I have been rendering a view of my girlfriends kitchen to help her
choose colours to repaint her house. I've modelled it in POVray 3
and rendered it on both the Falcon and Mac at identical resolution/
quality/aliasing/etc... The PowerMac is only about 6 times faster
than the Falcon...My 030 is 32Mhz and 68882 is 16Mhz giving
about 1.25 times the float math speed of a normal 16Mhz Falcon.
Based on this the 200Mhz 603e in the PowerMac should be 8-10
times faster than the Falcon 030/882 combination but it ISN'T!

Why is this? Is it because MacOS 8 knocks the 603e too hard? :)

> Peter S.

User error or it's in your imagination. I just got Adobe Premiere 5.1. Lets
see if i can test the results. Anyone have a spare Falcon to borrow?

The answer is ni...But the line has expanded with new models on a annual
basis something the Jihads can't comprehend..High power and lower cost is the
norm in the mac market while you need a second income to purchase those TOS
clones..

Whats wrong with this picture? If you can figure it out I have an iMac light key chain to give out. I may have only grape left.

by Charlton Heston

Harvard Law School Forum February 16, 1999

I remember my son when he was five, explaining to his kindergarten class what his father did for a living. "My Daddy," he said, "pretends to be people."

There have been quite a few of them. Prophets from the Old and New Testaments, a couple of Christian saints, generals of various nationalities and different centuries, several kings, three American presidents, a French cardinal and two geniuses, including Michelangelo. If you want the ceiling re-painted I'll do my best. There always seem to be a lot of different fellows up here. I'm never sure which one of them gets to talk. Right now, I guess I'm the guy.

As I pondered our visit tonight it struck me: If my Creator gave me the gift to connect you with the hearts and minds of those great men, then I want to use that same gift now to re-connect you with your own sense of liberty ... your own freedom of thought ... your own compass for what is right.

Dedicating the memorial at Gettysburg, Abraham Lincoln said of America, "We are now engaged in a great Civil War, testing whether this nation or any nation so conceived and so dedicated can long endure."

Those words are true again. I believe that we are again engaged in a great civil war, a cultural war that's about to hijack your birthright to think and say what resides in your heart. I fear you no longer trust the pulsing lifeblood of liberty inside you ... the stuff that made this country rise from wilderness into the miracle that it is.

Let me back up. About a year ago I became president of the National Rifle Association, which protects the right to keep and bear arms. I ran for office, I was elected, and now I serve ... I serve as a moving target for the media who've called me everything from "ridiculous" and "duped" to a "brain-injured, senile, crazy old man." I know ... I'm pretty old but I sure Lord ain't senile.

As I have stood in the crosshairs of those who target Second Amendment freedoms, I've realized that firearms are not the only issue. No, it's much,

much bigger than that.

I've come to understand that a cultural war is raging across our land, in which, with Orwellian fervor, certain acceptable thoughts and speech are mandated.

For example, I marched for civil rights with Dr. King in 1963 -- long before Hollywood found it fashionable. But when I told an audience last year that white pride is just as valid as black pride or red pride or anyone else's pride, they called me a racist.

I've worked with brilliantly talented homosexuals all my life. But when I told an audience that gay rights should extend no further than your rights or my rights, I was called a homophobe.

I served in World War II against the Axis powers. But during a speech, when I drew an analogy between singling out innocent Jews and singling out innocent gun owners, I was called an anti-Semite.

Everyone I know knows I would never raise a closed fist against my country. But when I asked an audience to oppose this cultural persecution, I was compared to Timothy McVeigh.

From Time magazine to friends and colleagues, they're essentially saying, "Chuck, how dare you speak your mind. You are using language not authorized for public consumption!"

But I am not afraid. If Americans believed in political correctness, we'd still be King George's boys-subjects bound to the British crown.

In his book, "The End of Sanity," Martin Gross writes that "blatantly irrational behavior is rapidly being established as the norm in almost every area of human endeavor. There seem to be new customs, new rules, new anti-intellectual theories regularly foisted on us from every direction. Underneath, the nation is roiling. Americans know something without a name is undermining the nation, turning the mind mushy when it comes to separating truth from falsehood and right from wrong. And they don't like it."

Let me read a few examples. At Antioch college in Ohio, young men seeking intimacy with a coed must get verbal permission at each step of the process from kissing to petting to final copulation ... all clearly spelled out in a printed college directive.

In New Jersey, despite the death of several patients nationwide who had been infected by dentists who had concealed their AIDs --- the state commissioner announced that health providers who are HIV-positive need not .. need not ... tell their patients that they are infected.

At William and Mary, students tried to change the name of the school team "The Tribe" because it was supposedly insulting to local Indians, only to learn that authentic Virginia chiefs truly like the name.

In San Francisco, city fathers passed an ordinance protecting the rights of

transvestites to cross-dress on the job, and for transsexuals to have separate toilet
facilities while undergoing sex change surgery.

In New York City, kids who don't speak a word of Spanish have been placed in bilingual classes to learn their three R's in Spanish solely because their last names sound Hispanic.

At the University of Pennsylvania, in a state where thousands died at Gettysburg opposing slavery, the president of that college officially set up segregated dormitory space for black students.

Yeah, I know ... that's out of bounds now. Dr. King said "Negroes." Jimmy Baldwin and most of us on the March said "black." But it's a no-no now. For me, hyphenated identities are awkward ... particularly "Native-American." I'm a Native American, for God's sake. I also happen to be a blood-initiated brother of the Miniconjou Sioux. On my wife's side, my grandson is a thirteenth generation native American ... with a capital letter on "American."

Finally, just last month ... David Howard, head of the Washington D.C. Office of Public Advocate, used the word "niggardly" while talking to colleagues about budgetary matters. Of course, "niggardly" means stingy or scanty. But within days Howard was forced to publicly apologize and resign.

As columnist Tony Snow wrote: "David Howard got fired because some people in public employ were morons who (a) didn't know the meaning of niggardly,' (b) didn't know how to use a dictionary to discover the meaning, and (c) actually demanded that he apologize for their ignorance."

What does all of this mean? It means that telling us what to think has evolved into telling us what to say , so telling us what to do can't be far behind.

Before you claim to be a champion of free thought, tell me: Why did political correctness originate on America's campuses? And why do you continue to tolerate it? Why do you, who're supposed to debate ideas, surrender to their suppression?

Let's be honest. Who here thinks your professors can say what they really believe? It scares me to death, and should scare you too, that the superstition of political correctness rules the halls of reason.

You are the best and the brightest. You, here in the fertile cradle of American academia, here in the castle of learning on the Charles River, you are the cream. But I submit that you, and your counterparts across the land, are the most socially conformed and politically silenced generation since Concord Bridge.

And as long as you validate that ... and abide it ... you are-by your grandfathers' standards-cowards.

Here's another example. Right now at more than one major university, Second Amendment scholars and researchers are being told to shut up about their findings or they'll lose their jobs. Why? Because their research findings would undermine big-city mayor's pending lawsuits that seek to extort hundreds of millions of dollars from firearm manufacturers.

I don't care what you think about guns. But if you are not shocked at that, I am shocked at you. Who will guard the raw material of unfettered ideas, if not you? Who will defend the core value of academia, if you supposed soldiers of free thought and expression lay down your arms and plead, "Don't shoot me."

If you talk about race, it does not make you a racist. If you see distinctions between the genders, it does not make you a sexist. If you think critically about a
denomination, it does not make you anti-religion. If you accept but don't celebrate homosexuality, it does not make you a homophobe.

Don't let America's universities continue to serve as incubators for this rampant epidemic of new McCarthyism.

But what can you do? How can anyone prevail against such pervasive social subjugation?

The answer's been here all along. I learned it 36 years ago, on the steps of the Lincoln Memorial in Washington D.C., standing with Dr. Martin Luther King and two hundred thousand people.

You simply ... disobey. Peaceably, yes. Respectfully, of course. Nonviolently, absolutely. But when told how to think or what to say or how to behave, we don't. We disobey social protocol that stifles and stigmatizes personal freedom.

I learned the awesome power of disobedience from Dr. King ... who learned it from Gandhi, and Thoreau, and Jesus, and every other great man who led those in the right against those with the might.

Disobedience is in our DNA. We feel innate kinship with that disobedient spirit that tossed tea into Boston Harbor, that sent Thoreau to jail, that refused to sit in the back of the bus, that protested a war in Viet Nam.

In that same spirit, I am asking you to disavow cultural correctness with massive disobedience of rogue authority, social directives and onerous law that weaken personal freedom.

But be careful ... it hurts. Disobedience demands that you put yourself at risk. Dr. King stood on lots of balconies.

You must be willing to be humiliated ... to endure the modern-day equivalent of the police dogs at Montgomery and the water cannons at Selma.

You must be willing to experience discomfort. I'm not complaining, but my own decades of social activism have taken their toll on me. Let me tell you a story.

A few years back I heard about a rapper named Ice-T who was selling a CD called "Cop Killer" celebrating ambushing and murdering police officers. It was being marketed by none other than Time/Warner, the biggest entertainment conglomerate in the world.

Police across the country were outraged. Rightfully so-at least one had been murdered. But Time/Warner was stonewalling because the CD was a cash cow for them, and the media were tiptoeing around it because the rapper was black. I heard Time/Warner had a stockholders meeting scheduled in Beverly Hills. I owned some shares at the time, so I decided to attend.

What I did there was against the advice of my family and colleagues. I asked for the floor. To a hushed room of a thousand average American stockholders, I simply read the full lyrics of "Cop Killer"-every vicious, vulgar, instructional word.

"I GOT MY 12 GAUGE SAWED OFF I GOT MY HEADLIGHTS TURNED OFF I'M ABOUT TO BUST SOME SHOTS OFF I'M ABOUT TO DUST
SOME COPS OFF..."

It got worse, a lot worse. I won't read the rest of it to you. But trust me, the room was a sea of shocked, frozen, blanched faces. The Time/Warner executives squirmed in their chairs and stared at their shoes. They hated me for that.

Then I delivered another volley of sick lyric brimming with racist filth, where Ice-T fantasizes about sodomizing two 12-year old nieces of Al and Tipper Gore.

"SHE PUSHED HER BUTT AGAINST MY ...."

Well, I won't do to you here what I did to them. Let's just say I left the room in echoing silence. When I read the lyrics to the waiting press corps, one of them said "We can't print that." "I know," I replied, "but Time/Warner's selling it."

Two months later, Time/Warner terminated Ice-T's contract. I'll never be offered another film by Warners, or get a good review from Time magazine. But disobedience means you must be willing to act, not just talk.

When a mugger sues his elderly victim for defending herself ... jam the switchboard of the district attorney's office.

When your university is pressured to lower standards until 80% of the students graduate with honors ... choke the halls of the board of regents.

When an 8-year-old boy pecks a girl's cheek on the playground and gets hauled into court for sexual harassment ... march on that school and block its doorways.

When someone you elected is seduced by political power and betrays you ...petition them, oust them, banish them.

When Time magazine's cover portrays millennium nuts as deranged, crazy Christians holding a cross as it did last month ... boycott their magazine and the products it advertises.

So that this nation may long endure, I urge you to follow in the hallowed footsteps of the great disobediences of history that freed exiles, founded religions, defeated tyrants, and yes, in the hands of an aroused rabble in arms and a few great men, by God's grace, built this country.

If Dr. King were here, I think he would agree.

Thank you.

again propogating an untruth. The Milan costs $899 US, even less when you buy the motherboard and "roll your own". And it includes standard ports, a nice modern operating system and PCI card slots.

And all this coming from a self-proclaimed "expert" who admits his only ST experience comes from a single use of a machine with TOS 1.0 - and who constantly mistakes his Mac for his manhood.

That's one of the 12000 3th party products, where are the 11999 others?

BTW: This is what I call misleading information.....
The press release clearly states that its for USB equiped personal
computers... Its here allright, but no MAC version in sight yet....
You see TIFKAS, to drive it you need drivers, gues what, no MAC drivers
included-)

Why should Roland go to the trouble writing them anyway ?
There's no decent MIDI software on the Mac platform for this device, and
firms like Steinberg and EmagiC have made it quit clear that they will
not support the crummy machine you love so much....why would that be?
The machine that is according to you selling like hot cakes, and none of
the big boys want to support it....

So, go and get the USB Midi processing unit, write your own driver and
while you're at it write your own version of Cubase..... that's what I
like about Mac Users...they think different.

Cheers from Belgium
Dennis

Typical SinDrop response.

So you would still accomplish the job if your marketing led to no/low sales being made by Apple distrubitors? (This thread is beginning to not make sense after you cut out parts that you failed to dispute earlier, Dick Head).

BTW, the Commander of NAWCWDPS emailed a statement concerning no new purchases of Apple machines for the NAVY (NAVAIR). He stated that he has made the transition over to NT, and is really satisfied with the move, and is sure that all NAVAIR employees will feel the same.

Why don't you take your superior marketing efforts to NAVAIR? Or is that not your zone? I would really like to see a dweeb like you try to promote a failing platform to the Dept of the NAVY......

Well in my dictionary Advocacy is defined as "one who pleads the case for"
and in the context of "Atari Advocacy" equals "one who pleads the case for
Atari".

This is why I object to the messages about iMacs, as they DO NOT even attack Ataris, nor even mention Ataris.

NO! YOU GO AND FIND ANOTHER NEWSGROUP, IF YOU'RE NOT GOING TO EVEN MENTION ATARI, THEN YOUR MESSAGES DO NOT BELONG HERE.

Cheers!

James

Were you here watching it? There is NO error and I am definitely NOT
imagining things. I created the scene file, a special include file defining
colours from a scanned colour chart, some image maps etc...on the
Falcon, rendered it at 640x480, and then imported the lot via floppy
to the Mac, and re-rendered it at the exact same res/aliasing/quality etc...

The only difference I noted between the 2 final TGA files was a small
difference in random seeding for some nice woodgrain textures I had
created.

Of course 6 times faster is significant, but I just would have expected
more from a 200Mhz CPU, especially for float math!!

Regards,

Chris Wilkinson,
/|\ ATARI Falcon030.

So what? Atari designed in MIDI ports when the ST was designed in 1983-1984, thus creating the World's No.1 computer for music, which it still is.

And still the other computer manufacturers still don't see the need to provide them as standard. As long as they do that, Ataris will rule.

Cheers!

James

>It's advocacy stupid!  Than get a free local calling internet ISP and quit the
>whining!

But that was what I was saying: we don't have a FREE LOCAL CALLING ISP in
the UK. We have to pay for every second that we are online. Local calls
are all charged for by the phone companies. Yes we have ISPs that have
local access, an ISP wouldn't last long if they didn't. But this is why
the North Americans are more into the Net than we are. Which also explains
why Ataris are more in use here than in the States, as we have more costs
than you.

Cheers!

James

The Atari 520ST is the most multi purpose multi functional computer ever made for the home computer market in 1985.

Today in the year 1999 the Atari 520 ST is still being used on a daily basis by users who chose to purchase Atari over the lesser brands and more expensive brands.

While other less educated users have paraded through a long line of newer computers trying to keep up to date the ST remains a Stable element to all Atari users.

Clearly no other computer from 1985 has survived the test. When purchasing a computer that won't be obsolete, the ST has proven that the life span of a computer is not 2 years, but that it is 15 years and more.

Where are the expensive Macs of yesterday, today? While once considered the leading edge, clearly all Expensive macs have proven that you have merely flushed your money down the toilet.

IBMPC compatibles of the same era are long gone into the bit bucket. Not capable of anything then, today they merely show up in the technological waste bin.

Amiga? Strange but true the 1000 Amiga was both expensive and rough around the edges. Long an Atari adversary, the amiga was a failure in its early incarnation and early users paid a hefty price for that 256 k machine.

But the 520ST with all of its faults in its rush to the market, truly was the best compromise in all things computing. Proof is in the fact that no other computer from that era has software written for it in todays market.

How could one ever complain of a computer where you can get NEW software 15 years after it release. This software allows for all the modern uses that they current platforms demand.

Clearly computers 2 years old are having difficulty running the latest software for their OS, resulting in forced obsolescence of computers with superior hardware and processing power to the ST.

And while the ST is capable of running MINT/GENEVA/TOS/and Magic it is really Magic that makes the ST fly while multi tasking. This premptive software is found on many Ataris and not even found on current Mac platforms from the warehouse. They are still living in the cooperative state.

Like the Mac of its day the ST has a monochrome monitor. Unlike the Mac of its day the ST can surf the WEB. And it can surf the WEB with the FIRST VERSION OF TOS Also unlike the Mac the ST has COLOUR. This allows web browsing in Monochrome, 16 colours or grayscales. While this may not sound impressive by todays standards, the results on screen are respectable. Other computers from this era CAN'T DO IT PERIOD.

A computer of 1985 specs being able to WEB BROWSE handle JPEG and MPEG compression as well as being flexible enough to interact with every platform makes this computer clearly the computer of choice for any purchase in the year 1985. If only they had the hindsight.

However really impressive is the STs ability to play:
AVS, AVI, DLT, MOV, QT, SEQ, FLM, FLI, SPS and MANY MANY MANY MANY MANY more animations found on the internet.

Today a 520ST is the CHEAPEST internet computer available. Technical help on comp.sys.atari.st is more advanced than can be found in any computer store.

And it gets better. The ST is the lowest common denominator. It can do it all. It does all functions with very respectable speed. The ST is the sportscar of computing.

After the ST the rest of the Atari line offer improvements that enhance using your TOS based software.

MegaST
STe* WOW 24BIT FILES RENDERED WITH PHOTOCHROME!!! Super Results. Huge files:-).
TT
MegaSTe
Falcon

15 years later and my ST is clearly the best computer I have every purchased.

I use it for all my computing needs.

As for the Mac user who once claimed to owning an Atari, and always
is asking if a "520ST" can do this or that.

Start with
http://www.rhein-main.de/people/robert/index.htm
then grab the UDOIT ST Files.

These are some hardware mods that advance a 520ST to more modern specs from its 1985 roots. However my 520ST short of 2 megs of Ram I put in in 1987 is bone STOCK.

Comparing the Imac to an ST is silly. One computer has a cult status and a large software selection and some dedicated users as well as some very trick optimised software. The ST can also be found for AS MUCH AS $20 US:-).

The other computer is obsolete and will be known for its significants as being the last nail in the coffin of Apple computing.
Too different, too little, too late.

Perhaps it is time to find a used ST and join in on the fun of having an Atari. They are easy to use. But really it is the people who make it fun.

With the Atari, the computer speaks for itself and the egos are left at the keyboard. There is little to brag about because it just does it. Thats it, thats all, its that simple.

Later Brian.

I have the following for sale. I prefer to sell the whole lot as a package.
However, I am willing to sell individual items but the ST must sell as a unit
and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE:
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, Alpha
Data trackball, manual, System & language disks, and mouse cleaning ball.

GAMES:
GBA Championship Basketball The Sentry
MetroCross   Star Glider

Guild of Thieves   Star Ray   Shadow of the
Beast II
                    AD&D Hillsfar   Gold Runner II
Station Fall   Golden Path   Grid Iron
      The Black Cauldron
Battleship
Pirates of the Barbary Coast   Flight Simulator II

APPLICATIONS:
Habba Check Minder   H&D Base   Hippo Pixel
Hippo Fonts   Cyber Sculpt   Art & Film Director
Multi Desk   Calamus Outline Art   OutBurst 3.3
VIP Professional   Flash   That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

BTW, I am not leaving the Atari scene.

Well I just subscribed to this group and had a good laugh reading
some of these messages. Here is what I have to say:
I own a Nemesized Falcon030 and a MegaSTE
I also own a Revison B iMac
and a Pent233..

Which one of these do I like best?
The Falc ofcourse! Its actually fun and cute to use, and handles
alot of things much better then any of the other computers.
For example, On all of the Usenet Readers in order to subscribe
to a group you must download the complete group listing, but with
Newsie for example, if you already know the name of the group,
just click on subscribe and type it in. Although this seems
small, there are many littlie things like this that can drive you
crazy.
I do use magiCMac on the imac quite a bit, and the jinne desktop
is faster then finder and has way more features. It's like Night
and day..

really, there is nothing I do on the imac or pc that I cant do
just as well, and easier on my falcon except for overated crap
such as mp3 (Which faster falcons can do..) and S**t games which
I don't play anyways.
Anyways.. I should get to bed
Bengy

The new episode of Back In Time has been posted. This episode features an extensive interview with Curt Vendel, curator of the Atari Historical society. Curt and I discuss all aspects of Atari history. This is the longest show to date. (Just over 40 minutes.)

To stream the show through the Internet, click on the GT2K option on the Back In Time web site.

Due to multiple requests, I have also set up an archive of all of the shows, including the new episode. These may be downloaded for offline listening. To access these shows, click on the "Radio Show Archive" option at the Back In Time web site.

All aspects of audio quality have been improved on this new show. The Real Audio player is required to hear the shows.

The next episode will feature Dana Henry, Public Relations Director for Hasbro Interactive. That episode should be posted sometime around Sunday April 11th. We will discuss Hasbro's plans for the Atari properties, the BattleSphere situation, and their recent classic game updates such as Frogger and Centipede.

The Back In Time mailing list has been set up. Be sure to sign up, and have the latest classic gaming/computing news and information sent directly to you via E- Mail.

The Back In Time website has been through some changes in the last few days to fix some font and color issues with Netscape Navigator. If you are using Navigator, the site should look better now.

Hmm, nope, everything is correct as posted. Perhaps you could tell me what part confuses you. It is posted with a post marketing enthusiasm that is simply meant to catch ones attention. The facts are the facts. I would be suprised if you used an ST on the internet? In fact I haven't even posted anything outrageous. I am merely stating what my STock 520ST is easily capable of. I certainly never mentioned MP3 nor Java. Then I might be caught with some serious embelishment flaws.

I can only think of two possible answers to your rude reply.

1) You are an ignorant (lacking in knowledge) user of more powerful Atari equipment and you have failed to include the ST in your thought process.

2) You are a user of another platform and quite frankly are clueless. Normally these people own IBM PCs and MS products, however these users usually know nothing of Ataris nor can they be bothered trying to find out anything about them let alone waste valuable bandwith replying. Therefore you are most likely a NON INTEL user. Leaving only Amiga and Mac. Amiga users have bigger problems of their own than to worry about Atari, and the Amiga Atari wars, while Great as they were are now part of OS history. Therefore you are a Mac user with limited knowledge.

Luckily for me I have been winning bets and now I am on my second year of FREE INTERNET ACCESS for merely hooking up and using my ST on the internet. No big deal.

Since you are rude , while I am only trying to have some fun in comp.sys.atari.advocacy I think you have received more of an answer then you deserve.

I am no fool.

Later Brian.

I have the following for sale. I prefer to sell the whole lot as a package. However, I am willing to sell individual items but the ST must sell as a unit and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE:
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, l, manual, System & language disks, and mouse cleaning ball.

GAMES:
GBA Championship Basketball The Sentry
MetroCross   Star Glider
Star Ray   Shadow of theBeast II
Guild of Thieves   Golden Path
AD&D Hillsfar   Gold Runner II
Station Fall   Grid Iron
The Black Cauldron Flight Simulator II
Battleship
Pirates of the Barbary Coast

APPLICATIONS:
Habba Check Minder   H&D Base   Hippo Pixel
Hippo Fonts   Cyber Sculpt   Art & Film Director
Multi Desk   Calamus Outline Art   OutBurst 3.3
VIP Professional   Flash   That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

BTW, I am not leaving the Atari scene.

I think it's because he hasn't figured how to switch them on;) and so
he's put them to one side until he's worked it out;)

>Compassionate Conservatism..

I did not say it's equal ... I said it's better, just judge what you can do with the equal amount of money spent. More with the PC. Perhaps you personally can't do much because of limited perspective but that's a totally different matter.
     Tell me, why is it that Apple adapts PC hardware to their system and not vice versa?

>> Beleive me, I've been working with Macs, I have surfed the webb. I've

>> also worked as a reseller, repairman and supportsperson. Have you?

>
>Oh gee...thats a comeback? How about a Quadra or first gen PowerMac?

Do you need everything troughly explained before you get it? Ok, see
architectures that are equal ... then see performance. Then the Mac
has a hard time. Just like the iMac has.
     Like the MacOS ... MacOS was not first OS with drag and drop
GUI, not first with the icons and the trashcan. Digital did it first
in their OS called GEM ... which is what we use on Atari by the way.

>hand?

now I certainly don't recall that spam you've posted as having any hard numbers either, so why should I produce any? All it basically claimed was that "iMacs were sold out or hard to come by all over Canada" at this moment. I just simply made a few phone calls and showed that it was NOT the case (in fact, one employee at a Computer City told me the article was "greatly overstated").

>>
>> and again, the claim was made that iMacs were "hard to find" and

yes, a big difference - empty warehouses do not equate "sold out all over the country" when stock is still sitting on the shelves and stores have to apply rebates to sell them....

>>
>> ah, yes, the Powerbook. Certainly a great success - which is why

>
>Ducking the issue here. At least we have a below $2000 PB to make up for low
>iMacs...

not ducking the issue. Simply pointing out that the PowerBook, despite your constant drooling, appears to have failed to have revolutionized or caught on with the public to have Apple blowing them out at the Apple version of fire-sale prices...
>
>When will there be a TOS laptop? Year 2003?

there already is a TOS laptop - it's called running GEMulator, TOSBox or MagiCPC on a PC laptop, or MagiCMac on a Powerbook. Works quite well, as a matter of fact.

Of course, I wouldn't put it past the Milan team to surprise us with a home-grown laptop in the near future :)
>
>Why would I need a second PB for? When I got the PB 3400 at the time, I

>stopped using my Performa 6200 and sold it to a School Teacher.

you constantly brag loud and long about how insanely great the current Macs are, and then don't follow through on spending the money to back it up. Surely someone of your income bracket should be able to afford the new G3 Tower, rather than to accept handouts from your employer of yesterday's technology?

>
>> No Cheezy Poofs for you until you finish your strained spinach,

TOS notebooks/laptops exist right now!
they are MAC or IBM hardware, but their operating system is TOS.
superior pre-emptive(or co-operative) multitasking at twice the speed.

My 040 Falcon easily outperforms my Quadra, and if your talking about the 60Mhz PPC's, they are hampered by the OS. Sure, the processor is faster, but you rarely get the chance to feel the power. On the Falcon, at least the 040 performs well, and is not burden by an OS that took the hardware ten years to cache up to......... Dick Head.

I admit that I haven't used as many scanners that PC shopper test in a year, but most of the models, and software too, default to either 8 bit or 24 bit color (probably with the newer scanners, it's more like 30 or 36 bit color, regardless of what the human eye can see). I doubt that there is a 12 bit setting, at least for consumer products.

There reason for this, I believe you quirred, is to provide the software as much color information as possible in order to reproduce the scanned image as closely as possible on a printer.

I'm sure that 12 bit, which was probably digitally converted at some point from either 24, 30, 36 bit, is fine for transparent XRAY film. 12 bit information for the 1440 DPI Epson printers, and the Epson Photo, would reduce the reproduction quality.

You were talking about a grayscale image. A grayscale image only needs a single channel. The scanners that you are refering to are color scanners and use three channels. That means that a 36-bit scanner can have three 12-bit channels. When scanning a grayscale image, the color channels will be identical so you are wasting a lot of space to store the same information as could be stored in a 12- bit single channel image.

> There reason for this, I believe you quirred, is to provide the software as much color information as possible in order to reproduce the scanned image as closely as possible on a printer.

Grayscale doesn't have any color information, only intensity information and 4096 is a lot of intensities.

When printing a grayscale image on a CMYK printer, you are sending zero values
for every component except for the K (black) component. So really you are
wasting space storing the image using 24, 30 or 36 bits per pixel when you
really only have 8, 10 or 12 bits per pixel of interesting information.

Mr. Sinclair,
Once more you shoot your mouth off before checking you facts. Although the one single Byte processor test does show that the G3 is indeed faster that the fastest Intel. You fail to mention ANY of the other BYTEMARK tests.
WHY?
I would direct you to read a review on popular PC's (low-priced and expensive) and
Macs running G3's. Specifically the Popular Mechanics article. I choose Popular Mechanics because THEY are not a biased PC suffragette. In the article the G3 bested
every PC processor from AMD, Cyrix/IBM, and Intel. However the G3 based Apples produced the worst real world performance of any of the machines including the cheapest machine tested. Which happened to be a AMD K6-2 300 based PC for $699.00 complete. (32 megs, 32x CD, 4 Megs video, FLOPPY, 6 Gigs HD, 56K modem, 2 USB, 17" inch monitor. Montego sound......)
Could it be that the G3 is stunted by inferior board throughput.
So inferior that the Baltimore City, Baltimore County, Harford County, Howard County,
Anne Arundel County, Carroll County, Montgomery County, and Prince George's County boards of education's' have all dumped the Mac as the official computers of choice.
Background on this area: 2.5 million population
Statistically the most affluent area per capita on the east coast
>480, 000 students
Per capita average income of the 7 Counties >108,000
Obviously not your back woods locals, But a sophisticated affluent professional population.

I am not saying that Apple is dead in these schools. far from it. But I thought you
might like to know that current and future purchases of machines currently is 20 to
25 to 1 in favour of Win Tel machines.

Why always catching up...why not be the first for once? Deja is here and the future as a portal. I find the news readers obsolete and very limiting. Also the Usenet feeds through earthlink is rather limiting. I prefer the
portal route with my personal channel..

You might be interested in hearing that all of the major portals are now having huge
problems. In a nutshell 1. Information gathered by these portals about their
subscribers is being treated now legally in the same manner as personal information
held by ISP's Big Brother is going to take your anonymity (once a prime reason for
using a portal) away. As I mentioned once before WE ARE ALL AT RISK by what we say
at least in the USA and Canada.
Admittedly these laws are silly but I will repeat myself. Big Brother wants to squash
our rights. For more info visit:
 http://www.news.com/News/Item/0%2C4%2C33560%2C00.html?dd.ne.htmldisp.hl.ne
By the way this page should be CAB 1.5 friendly
Why is Earthlink limiting?
Because you can no longer access it and violate Earthlinks T.O.S. in the process?
For those readers not in the know Earthlink now prevents outsiders from accessing its
News group server after several outsiders utilized the server to spam and harass
certain newsgroups.

Lastly after a careful survey of Baltimore's CompUSA and Best Buys you will find
plenty of iMacs sitting in stores. Notice I said sitting not simply in inventory. On
average from all stores for every 50 to 150 PC's out the door an iMac gets sold. Not
very good numbers from Bill Gates second company.

Organization: Keeping The Atari Flame Alive
Newsgroups: comp.sys.atari.st,comp.sys.atari.advocacy,alt.atari

Agenda for the Wednsday, March 17th, 1999, meeting of the Toronto Atari Federation:

Are you considering migrating to another computer platform because you can't find drivers for the new inkjet and laser printers on the market? Have you had it with GDOS and its bitmapped fonts, and want to use the many Postscript Type 1, TrueType and Speedo vector fonts out there for your projects? Or are you craving for some system speed in the video output of your classic ST?

Then this upcoming TAF meeting may well be right up your alley - for we'll be doing a hands-on demonstration of the Behne Brothers' newest version of their screen accelerator/font handler! Now at version 5, NVDI optimizes the ST/TT/Falcon/TOS clones' video output for faster screen redrawing and updates, as well as acting as a superior font handling package that opens up the many public domain and commercial fonts enjoyed by Mac and PC users for use in many of the ST's word processor and art packages. PLUS! This new version of NVDI offers literally dozens of new printer drivers, including ones for the latest offerings from Hewlett-Packard, Canon and Epson. AND! If you're a user of a third-party graphics card, or use the MagiCMac and MagiCPC emulators. you'll be pleased to know that NVDI now no longer requires a special version to be installed...

We'll also be testing output from some of the many Atari programs that can make use of NVDI 5, utilizing a donated HP DeskJet 540, so you can see the results for yourself.

If printed output is your specialty, if you've been drooling over printers like the Epson 740, or if you want to put some spark in the ol' dog, the demo of NVDI was tailored especially for you! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month in the North York Memorial Community Hall on the lower (or concourse) level of the North York Civic Library at 5110 Yonge Street at Parkholme Avenue. Public transport users can take the TTC's Yonge-University-Spadina line to North York Centre Station.

Meetings start at 7:00 PM; admission for non-members is $2. A one-year membership is $25 CDN a year, which includes a subscription to the club newsletter PHOENIX and full use of the TAF BBS. TAF membership IS Atari support!

TAF Info: - 416-533-0504 or 416-766-4743
TAF Online! BBS - 416-421-8999 [8-N-1] now open to ALL Atarians

You misunderstood my correction when I said the image was a TIFF. It was
scanned  at 24 bit color. The photo was however black and white, but that is
continous tone, which was represented by color (24bit). What you say below is
true for a 256 shade gray scale image, but not in the case I was using. You
machine, especially a 60Mhz PPC would puke on this image working under
Photoshop.

Nuff said.

I did not know that the TOS bucket line had equal software...I thought it was
all public domain or shareware.

Try speed test when both machines are running either AppleWorks or MS Office
or Photoshop and get back to me.

The SE/30 is a 1989 model while the Falcon/030 came out barely in 1993..What
took so long?

Like the MacOS ... MacOS was not first OS with drag and drop
> GUI, not first with the icons and the trashcan. Digital did it first
> in their OS called GEM ... which is what we use on Atari by the way.

Oh PuLEAze....GEM was a horrible knock off..

I did not make the claim that iMacs were not selling off the shelf. You did.
All you made was phone calls and not a physical count. The salesperson were
of course going to say that there are plenty of Yums in the store to get you
in the store.

Until you can verify sell through and inventory on hand, you will have lost
this as well.

Hypo...A store typically sells 125 YUMS a month but has only allocated 50
units for the month. By March 11, 15 units remain(the unpopular color(s)
remain). What do you call this plenty?   I call it a disaster..

There not being blown out at fire sale prices.. Apple only reduced the 233
model to $1999 from $2299. I don't call that a blow out price. the pricing
on the others have not changed.

COMPAQ AND THE REST have reduced notebook pricing in the last month. Apple
is no different.

Oh, and why not just load the fucking Mac OS while I am at it.
It's funny you support a failing platform, and quote software that is a major
cause of its demise.

Lets see. I can run Photoline on my PII 450 (under NT or TOS on the same
machine). Whenever the Mac is supported well enough for the authors to port a
version over to the Mac, then we can run the compairson. Or, you could run one

of the fantastic Windows emulators on your Powersludge and load Photoline.
Either way you hack it, you have a machine that does not perform in a cross
platform enviroment as well as the PC (or TOS machine for that matter).

MS Office? I that wher Monica worked? Is Appleworks a spin off of Atari Works?

Like I said........Dick Head

    nope - the claim was made in the article in both the National Pest
(which you have now curiously dropped as proof) and in the Montreal
Gazette (which you posted and were crowing about - and now appear to be

eating crow over) were that iMacs were "in short supply" and in some cases "sold out and hard to get" - and with no hard numbers to back it up, only Apple's claims of an empty warehouse. Since you claim to be an "Apple Power Rep", you of all people should find it easiest to come up with hard numbers. The burden of proof is on YOU, not me.

And, BTW, if in your fantasy scenario the salesman told me that there were "plenty of YUMS in the store" to get me to come in when they had little or no stock, that salesman (and the store) would be in big trouble - it's called "bait and switch", and it happens to be a criminal offence here in Ontario, with huge fines handed out to the perpetrators. I think any salesman worth his salt at Computer City would think twice about telling that lie.

>
>Until you can verify sell through and inventory on hand, you will have lost
>this as well.

Nope, the burden of proof is on YOU, not ME, to prove inventory and sell-through - YOU are the one who claims to be the "professional". Or are you going to try the lame excuse of a "non-disclosure agreement" to weasel out of this one?

You remind me of an incident with Norman Mailer - how he picked a fight with a prize fighter, who then proceeded to pound the snot out of Mailer. Even though Mailer was reduced to chutney by the prize fighter, he hobbled away insisting he had won. You, TiFKAS, are acting like Mailer, since you have been constantly debunked, outsmarted, outshouted, and outed as a complete ignoramous who has been caught many times to be fudging your data in order to maintain the Steve Jobs Reality-Distortion Field�.

no, a disaster is trying to convince the public that there are "no iMacs available for sale in the stores" HERE and NOW, only to show that there are indeed plenty HERE and NOW.

My, it's March 11th - who has stock? Oh, lookee here in the March 11th Toronto Star - Computer Buyers Warehouse still has plenty of iMacs (including Rev. Bs) in stock. Both Computer Citys have stock on hand. CPUsed has lime, tangerine and strawberry iMacs in stock (strange, as they told me they only had lime last week - where DID they come from?) as well as offering Rev B. iMacs at $1599 & tax. Oh yes, and in NOW magazine, Computer Systems Centre on Spadina & College is advertising they have ALL FIVE COLOURS in stock! Gee, what's that funny smell - I believe the SJR-DF� is overloading it's circuits, guess it was never designed to handle so much truth and logic thrown at it :)

    When you find yourself in a hole TiFKAS, the first thing you do is
to quit digging. :)

    which means that Apple had to start blowing out Powerbooks at
fire-sale prices.

Macs original SCSI was a terrible creation. It was only after they adopted
the standard that it actually worked. What is the use of FireWire now with
USB? A PC owner could have ordered an ATI Rage before the iStapler was
available, but with better cards on the market, why would they bother?

FOR MR. SINCLAIR IF YOU DARE (oh I rhymed!)

ATTENTION ATTENTION ATTENTION

Hot off the press. IBM and Motorola dissolve their PPC pact and development
center.
IBM will shortly phase out the G3 (32 bit) and will replace it with the G4 (64
bit)
which is aimed solely at the server market. IBM states that one of the prime
reasons for leave the market is the fact that Apple killed off the clone market.
It
is IBM feeling that had such a market existed today the story would be different.
Sorry iMac Motorola will begin looking for other uses for its G3 as it now no
longer has the services of the IBM development team. Motorola is aiming the PPC
at
the communications channel now. So Apple may some find itself starved out of the
market due to a lack of new design chips.
Link to here for the story:

http://www.news.com/News/Item/0%2C4%2C33696%2C00.html?dd.ne.htmldisp.hl.ne

Interestingly enough to quote Martin Reynolds a chip analyst with Gartner Group
Dataquest
"On the other hand, Apple in no longer a performance story and the issue may well
be irrelevant

This was done a while ago.

> IBM will shortly phase out the G3 (32 bit) and will replace it with the G4
> (64 bit) which is aimed solely at the server market.

Where does it say this? It says: "...emphasis at IBM these days is on 64-bit
chips that are used in its in-house computer lines--not the Macintosh." I
didn't read anything about them phasing out the G3 or about the 64-bit chips
only being aimed at the server market.

> IBM states that one of the prime reasons for leave the market is the fact

No IBM didn't state this. Analysts did.

Interesting analysis. Motorola has been selling PowerPC chips to the embedded
market for years. Targetting communication systems is a very logical step
since these systems are really taking off and PowerPC chips offer high-speed,
low- cost and power efficient solutions. Remember that MIPS is able to
produce fast, cheap and power efficient chips (MIPS chips are prevelant in
Windows CE handhelds) with a fraction of the market of PowerPC chips.

The House has a bill set up for a vote ASAP on whether to charge LD charges for Internet access even if you dial-up locally. This is something that affects each of us. Please read and forward:

Congress will be voting in less than two weeks. CNN stated that the Government would, in two weeks time, decide to allow or not allow a charge to your phone bill equal to a Long Distance call EACH time you access the Internet.

The address is http://www.house.gov/writerep/

If you choose, visit the address above and fill out the necessary form!
If EACH one of us, forwards this message on to others in a hurry, we may be able to prevent this injustice from happening!

PLEASE PASS THIS ON!!!

Well ... let's see ... SCSI is a multiplatform standard, FireWire is Apple's so there you're right, ATI Rage was first on PC and the M68K has never ever been PC hardware.

>> I know facts ... you seem to read a lot of magazines.
>
>What facts are those?

Those you would need to actually compare two different brands of
computers but that you lack and wander off into beleiving instead of
knowing by experience. Specs and real benchmarks. Architecture design.

>The SE/30 is a 1989 model while the Falcon/030 came out barely in 1993..What
>took so long?

I am impressed! You actually got a point there. Atari was late with
advancing from the M68000, and we haven't made the PPC-jump that Apple
made either.

The Rage chipset was first on for the PC but the Rage 128 chipset was first available for the Mac. Also, Firewire ports were available in Sony computer systems before Apple included them on the new G3s. Adaptec also had (expensive) PCI firewire cards before the G3s were available.

> I am impressed! You actually got a point there. Atari was late with

So was Apple. Sun, NeXT and Apollo all used 68K processors and were usually a generation ahead of Apple. NeXT was even considering using PPC processors before they got out of the hardware buisness.

> There you proove your level of knowledge. I suggest you do some basic
> research in the area of computer history.

GEM was not, of course, a knock-off. I do agree with the horrible part.

Mac OS. Mac OS for example will drive the hardware in the areas of digital video editing and pre press. What about TOS?

The original SCSI began life on the Mac Plus and it worked well. FireWire is
for high performance while USB is for low cost connection which works well.
Check out the firewire hard drives and digital devices..

Yea can they order the Rage 128 card? First on MAC...

But the knock off OS is does not do as much as Mac OS. Nice Try..

As for the first Gen PowerMacs, install a G3 card from Newer...Can you do this
on a Falcon for low cost?

What demise? These software apps drive the platform. With the release of the
new $499 Mac OS server...will expand the base..

Unlike hack and slash apps that have caused erosion of the TOS base..

> Lets see. I can run Photoline on my PII 450 (under NT or TOS on the same

I used the Montreal paper to back up the National Post to counter your
reality distortion denial. Why not drop in to these outlets to see whats
left.. I can't comment on the numbers due to company confidentialy and NDA...

> And, BTW, if in your fantasy scenario the salesman told me that

NDA keeps me from disclosing plusvalid reasons.. All firms have this...You
can not disclose company information due to legal and cpmpetitive reasons.
Does your hardware store disclose company info to their competitiors?

> You remind me of an incident with Norman Mailer - how he picked a

The erosion of the TOS base was caused by hardware, not software. The software
is the only reason that it survives in the numbers it does today.

That is the point. It can be run on TOS hardware and Intel machines. It's just
not worth the time to port it over to the Mac considering the small user base.

Lets see, first you admit that your a Dick Head in the last reply, and now you
admit that it took Apple hardware ten years to cache up to their bloated O/S.
Boy, I should quit while I am ahead (not a Dick aHead:).
As far as the O/S not doing as much, I perfer to leave that up to client
applications. Having a choice more than color means more to some people than
others......

Sorry, that magazine is not available in this area. Neither are the new iStaplers. What is wrong with Apple marketing? Why can't I drive to my local Apple dealer and see this new product? Why can't I purchase an inexpensive clone of this item? Why is Apple going back to it obsolete Mac Plus/SE look for its new computer line? I want one with a 17" monitor. 15" is just to small. What should I do? My friends iStapler (in a town far far away) isn't as fast as the new Pentiums. How can I upgrade to a new PPC processor. He has 4gig of ram. How can I install that in an iStapler? If I open up a new iStapler to install a CD Recorder (it looks like the iStapler will take up all my deskspace, where now my digital LCD display sits) will it void its warrenty? I don't like any of the colors that are offered. When will it be available in transparent black or silver? I think the clear accessories suck. The scratches really show up now. Will Apple market a plastic repair kit to cover them up? Why dont you take a train the next trip you make, SinCrap?

Mike

an update to my continued refuting of The iDiot Forever Known As Sinclap's (TiFKAS) wild claims that the overpriced, overhyped, underpowered iMac is "sold out all over Canada"....

CPUsed (Bathurst & Dupont) - went in. Several in boxes, all lime green, on the floor. One set up for display - someone had messed up the arrangement of the desktop (I was kind enough to fix everything up for them). BTW, overheard a conversation by a salesman about why the G3 Powerbook had a fire-sale price drop - "because Apple has a warehouse full of these and they're having trouble getting rid of them, and they can't release any more new models until they're all sold".

Computer Systems Centre (Spadina & College) - about 10 iMacs on the floor in boxes, all five colours. Five iMacs on display on a round table - strangely, all facing butt-out rather than screen out.

FutureShop ad (Toronto Sun) - they're having a "clearance sale" of a number of slow-moving computers. Oh, look at this - they're selling off their iMacs. Their 233 mHZ "Rev B" iMacs! (My, if iMacs are supposed to be "so hard to get" in Canada, WHY ARE THERE STILL REV B.s AVAILABLE!)

Long & McQuades (Ossington & Bloor) - four iMacs on the floor, all in boxes. Two Rev. Bs, two YUMs (again, if the iMac is supposedly "sold out all over Canada", why are there STILL REV. Bs AVAILABLE!) Also did not see any iMac compatible MIDI-to-USB adapters which TiFKAS was swearing he saw at Apple's headquarters (in between boot-licking sessions with Steve Jobs?) But also noted - L&McQ were selling off a number of their Mac sequencer packages at fire-sale prices....

Gee, all I had to do was to walk into three businesses and I happened to find a good number of iMacs in stock (which strangely, TiFKAS swore that would be out of them by the middle of March). I stayed there in each place for around 15 minutes each, and didn't see crazed crowds searching for iMacs being sold every 15 seconds :). Now surely, the reporter for the National Pest (one of the sources of TiFKAS' wild claims) should have VERIFIED beforehand what was essentially an Apple press release by simply walking into an authorized Apple dealer and done a count (or even made a phone call).....

That explosion you just heard was the Steve Jobs Reality-Distortion Field� finally imploding into 17,670,002 micro-cells - the strain of trying to use it in the logic-laden enviroment of atari.advocacy was obviously too much. I'm sure that TiFKAS will have it up and running again for another batch of his steaming piles of drivel - as soon as he chokes down another bowl of his strained spinach. Will TiFKAS admit he made a boo-boo - or will he direct another of his brain-dead paranoid rants against imaginary "Atari Jihads" lead by his equally imaginary friend "Chunks", instead?

BTW, TiFKAS, I DO have a life. I just happened to be in those areas that day (my day off) and felt it was my civic duty to check up on stock apparently on hand - to show you up for the cheesehead you obviously are...

Daniel, I suppose you did at least notice the 12000 3th party products
and the 1600 new developed Mac software titles which are shipping
worldwide and selling like hotcakes according to TIFKAS ???

> searching for iMacs being sold every 15 seconds :

Lets be fair, TIFKAS said that every 15 seconds a iMac was produced, he
never said that these got sold at that rate... A normal person would
expect this, but in the case of TIFKAS.......

The big empty bubble will explode soon, I'll see you at the funeral
service TIFKAS..

Cheers from Belgium (iMac bursting out of the shops)

Dennis

    nope. None of the dealers had anywhere near what TiFKAS has been
claiming. Not even the imaginary "12 30-foot piles" which he claimed
about a year ago. At the most I would count around thirty-40 titles on
hand at Computer Systems Centre, which seemed to be the best stocked
one. I'm going out to the Etobicoke Computer City this weekend so I'll
get a firsthand look there as well (gotta be fair :) )

    Of course, could Steve "�berboss" Jobs be lumping PD and shareware
in with the commercial titles to come up with that rather high count? :)

Eh..iMike..

If you want larger monitor and expandibility get a blue/white G3. There will
be a USB CD recorder. As for other colors, thats upto Steve Jobs.

Because unlike Europe, trains are not available for a short distance between
MN and WI..Plus I get mileage...

Froom what you have written.., it seems that the iMacs are about gone. Looks
like BB, grape and Strawberry are nearly gone. Just the odds and ends left..

What about the other colors and rev B ones? Please tell me about the fire
sale PB pricing..Whats the current pricing up in the CA territory?

> Computer Systems Centre (Spadina & College) - about 10 iMacs on the floor
> in boxes, all five colours. Five iMacs on display on a round table -

Could be the empty shell display ones..
Just 10 iMacs left? Thats nothing...50 on hand would indicate slow sales..

> FutureShop ad (Toronto Sun) - they're having a "clearance sale" of a

Just four units left? Yep..imacs are slow sellers...-)....
I stated from the two news articles that reported that Apple's warehouse is
empty of iMacs..From the indications of near sell out of stocks would support
this.
Tell the stores to order the USB midi stuff. Just needs initiative and a
market...

Did you bother to read what you have wrote "Chunks"? There is low imac stocks
in the stores.. Having that inventory level supports the articles..

>   BTW, TiFKAS, I DO have a life. I just happened to be in those areas

ahhh, dodging the issue - according to your article there should be
LITTLE TO NO iMACS left at all in Canada! That includes Rev Bs. Plus, I
believe you were the one cackling about FutureShop carrying the iMac
and gloating that "they must be selling well".

More strained spinach?

>
>>   Long & McQuades (Ossington & Bloor) - four iMacs on the floor, all

    according to the articles you posted, there should be "little-to-no
iMacs available for sale" - which should also include Rev Bs. You also
brayed that by the middle of the month that all dealers should be out
of iMacs. My research proves you wrong as usual, weinerhead....

    too afraid to admit you made a boo-boo?

> Tell the stores to order the USB midi stuff.  Just needs initiative and a
>market...

    or maybe it's the fact that there's really no driver support for
the iMac yet - that's according to a MIDI professional I talked to at
TAF last week. STILL no support for the new Roland USB-to-MIDI adaptor,
which seems to be the major player. Or maybe they're waiting for a
version of Cubase (the major player for the Mac sequencer) that will
work with floppyless G3s (Cubase uses a key disc for the Mac - Jobs has
shot himself in the foot)

>

>All indications that you have stated would indicate that iMacs are about gone.

    according to the articles you quoted, the iMacs should have been
out of stock or hard to find at the time they were written. You also
claimed that by the middle of the month they should've been all gone.
Both scenarios have been proven wrong.

    Still in denial that the iMac is not doing as well as you're claiming?

>

```

>> friend "Chunks", instead?
>
>
>Did you bother to read what you have wrote "Chunks"? There is low imac stocks
>in the stores.. Having that inventory level supports the articles..

1) your imaginary friend "Chunks" does not exist

2) the articles claimed that it was hard to find an iMac. As again
I point out, I was able to walk into several Apple dealers and finding
a good number of them in stock, even at this late date - including Rev
Bs, which should have been all sold out by now.

When are you going to quit crying over the spilled milk?

The iMac Bunny: It Just Keeps Going and Going and Going.........

OK, when I started to really look closely at what the fourth quarter iMac sales looked like, I expected some drop off. Mostly because the initial rush of Mac bigots had subsided, and the end of the Q4 selling season spelled the peak of Apple's success in the retail market. After all, it seemed that the limited market of those individuals wanting to go "non-standard" would be exhausted and that our PC attention (which spans about two months) would turn to other hot products.

Well, that is certainly NOT what happened.

The latest data from InfoBeads shows that Apple has not only kept the momentum up, but they also actually gained share in the retail market in January. This gain shows that there is more long-term strength in the Mac market than I initially thought. The iMac has really held up surprisingly well and now, months after the initial spike, is still the third best-selling product in retail.

Source: StoreBoard

However, taking the best "what have you done for me lately" view of Apple - now that they've passed from Q4 into Q1 in good shape - I ask myself, "what does the future hold for them?" Well in the short term - that is through Q1- I think they are poised to continue to doing well. The announcement of the Pentium III put a real funk into the Wintel side of the market in February, a boon to Apple, and March looks better. Not only that, but the timing of the G3 advertising was excellent, hitting the market precisely when there was a dearth of PC advertising.

Longer term, it is clear that Apple has to start rebuilding share in business markets. This has happened a little bit in the small and medium business markets, but Apple clearly needs to add some weight to marketing here, as well as likely rebuild some burnt bridges with the smaller resellers. The CompUSA-based distribution strategy has taken a hit as that chain has had its share of problems of late, and Best Buy is not really a business destination channel.

So far, Apple has done very well. Yet they are not at the point where they can rest on their laurels. We'll be watching the results here at InfoBead Insider to see if the positive trend continues.

Peter S.
PowerBook G3/266....14'', 64MB, 4G's, ethernet, 56k, S-Video out....

I don't need a larger montior, but I would like to use an new 15" LCD digital
display. Can't the iStapler handle this?

My, my, seems that the iStapler is intended for a very specific user type. If you had any brains, you would have guessed by now, that type of user does not frequent this newsgroup.

>

I know nothing of trains in Europe. We do have a rail line that run close to town. Why can't the iStaplers be shipped by rail? Don't brag about your employment. Your about as laughable as Al Bundy. The "plus I get mileage" statement really shows your mentality. It's like bragging about something that everybody in outside sales receives. Your nothing special in that respect. But you are a first rate Dick Head.

well, TiFKAS, I see that rather than face the issues (including posting real-world results on how well the iMac is doing in Canada, as well as facing the fact that neither the "Atari Jihads" nor your imaginary friend "Chunks" exists), you choose once again to mindlessly post a press release - and probably never bother to read it, in a desperate attempt to make everyone forget that you're way overdue to eat your strained spinach.

well, two can play at that game. Please note that the below press release does not include any reference to MIDI solutions to the iMac...:

Blue G3 - MIDI/Digital Audio update

Hello, I'm a producer who tries to stay on top of the technical aspects of electronic music. One of the big issues for a lot of us surround compatability with the new Blue G3. A friend of mine put together a list of information/issues that are important to MIDI/digital audio users. [...]

Jeff Taylor
Producer at Large

Re: BLUE G3s and MIDI/Digital Audio

There's no real solid solution on the MIDI front that I'm aware of other than a Megawolf PCI card and Mark of the Unicorn's FreeMIDI 1.38. If you don't use MOTU stuff you're going to have to wait until the Opcode's [USB MIDI adapters] ship or the PCI serial card companies come through...

Roland is leading the USB MIDI interface pack with the SuperMPU interface but there's no Mac MIDI driver for it yet.

Griffin Technologies has pushed back the release date for the gPort to the middle of March from the middle of February. The gPort connects internally to the Blue G3 motherboard with a special bracket to mount the serial port inside the case. The gPort provides only one Mac DIN 8 serial connector.   When it's released almost all MIDI interfaces will work through it with the shipping version of Opcode's OMS (Open Music System 2.3.6).

A couple of serial PCI card companies will provide 2 to 4 Mac serial ports on a PCI card. An OMS compatibility solution for these PCI serial cards is in development by a third party and should be completed very soon. I can't comment on when until we know a little more about the situation.

USB OMS MIDI drivers are also in development. As soon as we get the drivers done the USB interfaces shouldn't be too far behind. Simple 2 to 4 port interfaces will arrive first. Large multi-port, multi-function interfaces will follow later.

USB (12Mbps) is 50 times faster than older Mac serial ports (250Kbps) but more devices will probably be connected to the USB bus than with older Mac serial ports. Devices that don't work properly or that take up too much bandwidth can have a negative impact on other devices on the USB Bus.

A rumor circulating about claims that the current FireWire drivers that come installed on the new machines can't time stamp data making it less interesting for audio or MIDI data delivery. More on this when I find out more about it...

If this is truly the case, the Mac OS will probably be updated to include support in the near future, or the FireWire drivers will be updated to support MIDI and audio over FireWire.

TIFKAS commented;

>take your head out of your arse and smell the weeds...
Hey, It takes one, to knows one...

Now, let me see, how shall i put this without hurting your
feelings:
You need to go to a optician as fast as you can, staring at the
crummy
tube from the IMac all day long, probably caused damage to you
eyesight
and brain (Daniel, does a TIFKAS person has a brain ?) or what's
left
of it....

<SNIP>
>- Apple has achieved 5 straight profitable quarters (FQ1'98 $47M,
FQ2
>'98
>$55M, FQ3 '98 $101
Lots of bullshit here...
> $1.7B was up 8% from the year ago quarter
<SNAP>
Where I come from, we call this "creative accounting",

>- Apple's overall unit growth was 49% year over year
From what ? compared with what? peanuts??

>- Apple's FY '99 Q1 gross margin of 28.2% was up from 22.4% in the

>year ago quarter
This proves my point, gross profits by selling overpriced,
overhyped,
flashy boxes to a lot of TIFKAS's.....

>- 45% of U.S. iMac purchasers are new to the Macintosh platform
I'll have a thought for them in my prayers

>- iMac was the number 1 selling computer October - December
through
>retail and mail order
Where, in Timbuktu ??

>- Over 12,000 3rd party products have been developed for the
Macintosh
Daniel, this guy is not a TIFKAS, he's a enormous big TIFKAS, I
suggest
you go to a doctor as quick as you can and have your head examined.

>- Over 1,600 new Macintosh software titles have shipped worldwide
>since the

>iMac was introduced last May
On second thoughts, don't go wasting the doctors time....

>- Over 25,000,000 Macintosh users have installed QuickTime on
their
>systems
In your dreams...., Where are those 25,000,000 users hiding ??

>- The G3 processor in every Power Macintosh is at least twice as
fast
>as it's Pentium II or III counterpart (Source: BYTEmark tests)
Have you heard of the Sun Visual Workstation SGI 320, running on a
Pentium II 450Mhz ? This computer was compared to the latest
Tupperware
box from Apple => G3/400Mhz, sorry mate, but the Tupperware Box was
the
slowest one in all tests. These tests are not benchmarks wich can
be
manipulated but real life tests, the two machines running Photoshop
apps,
rendering a animation, raytracing etc (Source Macup, March99), yes
a
dedicated Apple magazine -)))

>- A Pentium II would have to run at 800MHz to equal the
performance of
>a 400MHz G3 (Source: BYTEmark tests)
I rest my case.... TIFKAS

>- Apple has a 52% installed base share of the U.S. K-12 education
>market
Poor Kids, isn't there a law in the US against Child Abuse ?

>Apple has been involved with the PowerPC..including the Generation
3
>processor
Yes, and it shows, instead of being optimised for speed it's
optimised
to run the buggy Apple OS System.
What's going to happen when the G4 hits the street? the Yosemite
board
inside the Blue Tupperware Box is NOT suited -))) So, they'll have
to
come up with another series of boxes, perhaps we'll be seeing the
launch of a couple of more coloured boxes, and that's the PRO serie
??
New Box, new motherboard, new hype, new things to drool about
TIFKAS...

>Apple invented the FireWire technology as well as the tech in OS
8.5
>like
>Sherlock, Quicktime and the best USB implemintation..Also having

>developing
>Yum casings are original..
Apple DID NOT invent FireWire, what they invented is far less, they put down the principles and tech stuff of FireWire but it took IBM, SONY and Texas Instruments to name just a few, which developed FireWire into what it is now. The first implementation of what is now called FireWire could be found in a NEXT computer, the specs looked like nothing Apple defined in their IEE338xx standard.
Sherlock, is just a tool to help you find your way around in the chaos Apple created.
Quicktime was developed in another lifetime, and having the BEST USB implementation, just makes me wet my pants-))).

> System 8.5 is marvelous...
What has changed since System 7.5 ? Nothing, zippo, everytime Apple has to adapt their OS so it can run with the newest PC based hardware, they give it a new number, and for a "leading" computerfirm which leads the way, well, they have NEVER get it right from the start, System 8.5 is now 8.5.1, adding a few bells and whistles doesn't make a good OS, usally it makes it more buggy...

So, I rest my case and say it AGAIN:
Apple DID produce wonderfull machines and used to be a inventive firm, they introduced Quicktime and prevented Micro$oft to dominate for 100%.
Apple stopped developing Computers in 1995, when they switched to the PowerPC, open up a Mac and take a good look => PC Stuff all around,

even the latest pride and joy : the Yosemite motherboard is nothing

more then a adapted ASUS motherboard...
So all that's left is a firm that assembles clones which runs G3s, but lets give them a bit credit:
APPLE, Premium flashy computer casing manufacturer including tacky and clumsy keyboard& mouse.

I'll see You at the funural

-
Cheers from Belgium

have you tried Bengy Collins' site lately (http://bengy.atari.org)? He's supposed to have now added info where one can find all commercial MagiC-related products in North America.

But who knows - judging by the reaction both Ken and I have been getting regarding questions about where to find Atari stuff (Ken's been importing Mario Becroft's new hardware mods/adapters from New Zealand, and he's gotten a LOT of interest, particularly for the new VGA adapter dongle - in fact, he just sold two of them to US users), I may just go into part-time business importing the stuff for Canadian and NA users. Whadaya say?

    and speaking  of  new  developments -  remember  TiFKAS'  brain-dead
attack on the Hades, where he said we couldn't utilize DVD?

    well, I just downloaded the demo for Uwe Seimet's newest version of
HD Driver - lo and behold, there's DVD support built into the new
driver, as well as SCSI III. I have a funny feeling we'll be seeing DVD
programs for the Milan, Hades and Phenix coming real soon. Maybe even a
nice player program ala CD Player, which would turn even the lowliest
ST into a nice video control player for a DVD drive.

    That large sucking sound you hear is TiFKAS trying to extricate his
OTHER foot from his mouth....

One of the pages at the iCab site (www.icab.de) is a test page, with a
bit of more complicated html and an explanation (in German) what your
browser is supposed to display. Anyone who can read German can open it
in Netscape and have a good laugh :-(

yep. In fact, I think most of the vapour seems to be eminating from the centre of TiFKAS' intelligence :)

Honestly, if there's all these amazing products out there, then why can't I find them at the Mac dealers? That includes the professional Mac stores, CP Used, Computer City and of course the mass-volume stores that sell iMac.

Maybe we should challenge TiFKAS to name all 1600 titles :)

>BTW, Does TAF still do NEWSletters? Since it seems nearly impossible to
>make meetings, and since I haven't seen you post meeting dates, I would simply
>just like to join TAF and receive a newsletter every month.

it's possible - as a matter of fact, we've now dropped the price of membership in TAF to $25 a year, and I think we still offer a newsletter-only deal (maybe $20 a year). We've also recently relaxed our members-only policy to the BBS - we've now opened full use to ALL Atari/clone/emulator users. (416-421-8999)

BTW, next meeting is March 17th, where I'll be demoing NVDI 5.

I have incredible respect for Jeff Goldblum's acting talent, but he
really should have turned down having to spout off some of the blatant
hooey in the iMac ads. Maybe Apple should rehire him to plead with
consumers to at least considering buying the hideous orange iMac, which
Apple is having trouble unloading.

>

Not to mention that Opera seems to be doing pretty well charging for their browser.

You see, there are still _some_ people who will pay for quality.

Nope - I have not - I have been very busy rebuilding some financial books into the G3 and cursing at the clumsiness of some of the software after years of happy use of 'That's Write'(anything I need in a WP), 'LDW Power' (creaky and not as printer smart - but stable as hell), 'Pagestream' (flexible, stable and user friendly in a small package), and 'Informer II' (a bit flakey at times but still a nice database) - the connection to the net will have to wait until I get the 'work' done !!!

I'd be very happy to buy stuff from a Canadian Distributor - if it will run under MagicMac (OS 8.5) - the old Atari is just to slow and short of memory - and the new TOS clones are too unavailable to consider.

How about a way to boot out OS 8.5 in favour of Linux ???

The Canadian Curmudgeon (in snowy - 2cm of white stuff - Calgary)

Despite, Chunks asertion that the imac is overpriced...the market has spoken...the imacs have sold out in the U.S. territory up north...maybe Apple should of charged higher price..

Wednesday, March 03, 1999

Want an iMac? Join the waiting list

Paul Brent
Financial Post

Strawberry, blueberry, grape, tangerine, or lime.

No matter which is your favourite flavour, chances are slim that there's an iMac computer waiting for you on the shelf at a nearby Apple dealer.

Supplies of the bright, translucent iMacs are "severely constrained." That's Apple Canada Inc. PR-speak for "sold out until April."

"The demand even exceeded what we thought it would be," said Dennis Manning, an Apple Canada spokesman.

Grape, the most popular colour, has been consistently out of stock since the product's introduction in January. Likewise for blueberry and strawberry.

An enterprising would-be iMac owner might be able to track one down in lime, the least popular colour.

The computers, which sell for about $2,000, are a hot commodity because they do not look like their competitors' boring beige boxes, plus they are configured to run applications such as games faster than IBM-based machines that can cost twice as much.

"What Apple has done is dragged the computer sector into the mainstream of marketing," said Mr. Manning, the spokesman.

Besides home offices, iMacs are turning up in places such as design shops and advertising agencies, where looking cool is as important as being efficient. Apple likes to tell the story of the woman who brought her drapes into a store to make sure the colour matched.

In Orangeville, Ont., the Orangeville Family Medical Centre contributed to the shortage recently when it bought 28 iMacs for its doctors, nurses, and administrators. The centre's iMacs are all lime, not for design reasons but because it was the only colour available.

"They have a space-age look to them so it is often what people will comment on," said Dr. Cathy Candusso, who handled the purchase of the computers.

The centre staff deny they have become slaves to fashion, even though the iMacs match their green countertops. Dr. Candusso said the adoption of Mac Medical software dictated the use of Macs, and the iMacs were the cheapest option.

Peter S.

Isn't "stable" on "Windows" a contradiction in terms ... since Windows isn't stable, no browser can be :) Perhaps on NT4 (with great luck)

<rest of badly-distorted spam snipped>

1) sorry, your imaginary friend "Chunks" does not exist.
2) your grammatical syntax in the above is very poor, just like your spelling.
3) it's not just an opinion held by one person - a recent article in The Toronto Star mentions that many Canadians balk at paying over $1800 for the overhyped iMac.
4) your brainless spam comes courtesy of the National Post, a recent upstart "national" newspaper put together by Hollinger owner Conrad "Tubby" Black - a right-wing muck-raking rag that is considered by the newspaper-reading public, as well as the other newspapers, to be a national joke with ZERO credibility. (See the anti-Tubby web site http://blackenvy.com for what Canadians REALLY think of this blowhard and his business practises)
5) looking here in Toronto, there are still lots of iMacs sitting in boxes in the shops. Several companies are still having trouble unloading their Rev. B iMacs, even after the price drop, to the point of offering $150 rebates.

Seems when TiFKAS hears the market speaking, he's really hearing the echoes of �berboss Steve Jobs' reality-distorting mantras in his empty head .....

Oh yes, you'll notice there's no mention of the hideous orange colour iMac - which has been noted in the press in the US that Apple has been having trouble unloading (and has been mentioned on http://www.macintouch.com)

If the system is as widely spread as you claim, isn't there a newsgroup like comp.sys.mac.advocacy or comp.sys.mac.narcisists where you can all be the happy bunch of beleivers and not bother us in the Atari forums ... we like opinions not your advertisement or populistic "facts".

From what I can see you are in some strange way trying to make us beleive in the Mac phenomenon and it doesn't appear to you we wont. I have worked as an Apple Authorized Service Engineer and I still prefer my Atari before my Mac's or PC's (which I work with today). Atari's are robust machines that are in many ways more usable than Mac's or PC's, they do lot's by small means. Mac's costs a lot and does some. Windows boxes costs about nothing and does about the same.

There does not exist the same support and positive attitude we have in the Atari community in the Mac community, I'm so sorry. But I understand your viewpoints to a degree, It can't be easy to be the blind beleiver getting "facts" and not trying out and judging by yourself.

It's a Mazda.
Honda's have a better build quality and are generally safer (for occupants) in collisions, taking into consideration that in this country most people DO wear seatbelts. I believe that may not be the case in some countries.

Honda motorvehicles are more reliable, although generally very expensive to repair should you have a major mechanical failure, or any accident..

I worked in the trade for 10 years, so my opinion is based on personal experience with a large range of vehicles.

success. From...the Jihad 'Chunks' what will he come up to counter the Montreal Gazette. Another loony right wing nut running it..

http://www.montrealgazette.com/PAGES/990304/2337269.html

Colour the iMac popular

In Montreal, grape and blueberry prove the top choices

ALISON MACGREGOR
The Gazette

Apple's advertising campaign for its new candy-coloured iMac computers has whetted consumers' appetites.

Perhaps too much.

The machines - strawberry, grape, tangerine, lime and blueberry - are flying out of stores across Canada. And the most popular flavours - which change depending on what part of the country you happen to be in - are sold out until April.

"The demand even exceeded what we thought it would be," said Dennis Manning, an Apple Canada spokesman, in an interview, adding that Apple prefers "constrained" to "sold out."

Montrealers are not exempt from the frenzy.

"(We're) basically sold out," said Frederick Rosenberg of B.Mac le Magasin, Montreal's only computer store-lounge-cafe. He expects the next shipment in three to four weeks.

Yesterday, the store's iMac stock consisted of six French- language machines. But they were all in the least- popular colours in this city - strawberry and tangerine.

According to Rosenberg, the rest of Canada places strawberry in the top three.
But "here, it's the tangerine and strawberry that we're sitting on."

He said sales representatives have reported customers trying to match the their iMacs to their home-office decor.

"It happens all the time," said Rosenberg.

Still, he believes that people are more likely to match computers to their moods than to their home decor.

"They're just trying to get their favourite-colour kind of thing," said Rosenberg.

His son, for example, chose lime. "He was walking around and said, 'Daddy. Green.' "

Montreal's A1-Computers was also sold out of iMacs yesterday.

But the store sells mostly PCs, said Robert Robin, the technical manger.

"I think they're trying to make computers as fashionable as furniture, he said, commenting on the iMac's "teardrop-shaped system."

As for colour, he hasn't noticed any particular trends.

"We just special-order any colour the customer wants," he said.

We're sold out, but "just the top two colours," said Steve Knowlton, a sales representative at Central Audio Video in Ville St. Pierre.

He said there is a month-long waiting list for grape and blueberry iMacs.

But customers can still get lime, tangerine and strawberry.

"I must say the strawberry is very strange," said Knowlton. "It looks like it should be flashing."

Is there some deeper meaning to customers' flavour preferences?

"It's all about some psychological impression of colour," said Ella Uher, an art therapist at Concordia University's school of fine arts. She said people often make subjective choices based on reactions to particular colours, related to previous life experiences.

Don't cut it? And Calamus does? FYI: The last ST Calamus Jihad(who happens to work at the one of the CompUSA) in the Twin Cities will be trashing Calamus in favor of an all Adobe solution...Why? He is tired of the piss poor Calamus support, being ragged on for owning an Atari ST(not by me-I respect multiplatform chice) and also the Calamus files can't be read at Kinkos.

Macs costs alot? In what way?   The $1199 imac according to press accounts
have pretty much sold out. A certain Jihad 'Chunks' has criticised the
supposely high price of the YUMS. Looks like the market does not agree.

>   There does not exist the same support and positive attitude we

Subject: Canadian Stores Full of iMacs, TiFKAS full of it!
Date: 1999/03/05
Message-ID: <36df7a16.0@nemo.idirect.com>#1/1
X-Deja-AN: 451452616
X-Trace: 5 Mar 1999 01:30:46 -0500, ts7-50t-17.idirect.com
Organization: Keeping The Atari Flame Alive
Newsgroups: comp.sys.atari.advocacy

yesterday, you may have read one of TiFKAS' (The iDiot Forever Known As Sinclap) pathetic little screeds against his imaginary friend "Chunks" regarding a story from Canada's Other National Newspaper, The National Post (a.k.a. the Daily Tubby) in which they made the incredible claim that the iMac was sold out all over Canada!

Well, I (not his imaginary friend) decided that it might be interesting to see if indeed both TiFKAS and the National Pest writer had gotten his facts straight. And why not straight from the horse's mouth, a.k.a. the dealers.

So I quickly made a few phone calls to a number of known Apple dealers in the Toronto area, both in the 416 and 905 areas. Here's the results of that quick little survey:

- Computer City, Etobicoke: they had a large number of the iMacs in stock - and in all five colours.

- Computer City, Markham: they had a good number of iMacs in stock in red, purple, and the hideous orange colour. The salesman there was quite pleasant as he explained that the red and purple seemed to be the hot colours; he also told me that while he had not read the Daily Tubby article, he had been told about it by a colleague - and said that the claim was "greatly overstated".

- CPUsed, Greater Toronto Area: "sure, we have lots of iMacs in stock", said the salesman on the other line. "They're all green, by the way - how many would you like?" He seemed like he wanted to make a sale desperately.....

- MacWarehouse, GTA - advertising the heck out of the "Rev. B" iMacs they still have in stock in Thursday's Toronto Star, offering a mail-in $150 rebate that would bring the price down to $1450 CDN (gee, if the iMac was really "sold out" across Canada, there shouldn't be ANY Rev Bs left in store, eh?)

- Computer Buyer's Warehouse Direct, Markham: on the same page of the Star, advertising that they had iMacs in stock, ranging from 233-266 MhZ models (which means, of course, that they still have Rev. Bs in stock).

Now, class, what can we conclude from the above?

1) contrary to the National Pest article, there are plenty of iMacs available in stock in the Toronto area - and, most likely, the same can be said for the rest of the Apple dealers across Canada. While the computers are selling, they aren't selling as fast as TiFKAS would want us to believe.

2) Apple Canada has a bad habit of mistaking "product shipped" with "actual units sold". There IS a difference...

3) Conrad "Tubby" Black was so desperate to get Canada's Other National Newspaper off the ground that he would hire anyone off the street to report - and this particular reporter flunks by simply aping what was purely a press release from Apple Canada as opposed to actually checking the claim by visiting Apple dealers or, at the least, phoning them to see what the stock situation was at them (which I, a simple "Atari Boob", was able to do just which a touch-tone phone and a few minutes of my precious time).

4) years of being exposed to the Steve Jobs Reality-Distortion Field� has left TiFKAS' brain withered and useless. Surely a professional "Apple Power Rep" would take the time to also confirm with the stores that they were out rather than mindlessly post a press release. But then again, maybe he's out to do damage control on the problems he's facing on his side of the border, what with reports that a number of Best Buys have been dismantling their just-recently put up Mac departments and selling off all remaining iMacs dirt cheap...

I'm sure we'll be hearing from TiFKAS on this again - just as soon as he removes his soiled bib with the residue from his much-hated strained spinach which his poor suffering mummy has been trying to get him to eat (and has told him no Cheezy Poofs until he finishes...)

sorry, but you lose - because there is no such thing as an "Atari Jihad", nor does your imaginary friend "Chunks" exist.

And as for the iMacs being "on a roll", try they've had the bun - because my own research using just a phone and a few minutes of my time has shown that there are lots of iMacs for sale in the stores in the Toronto area...

Despite...The Jihad
>'Chunck' has a personal grudge against one who is more successful in regards
>to fame and wealth.

I (not your imaginary friend "Chunks") have a problem with a man who buys up competitors' newspapers and folds them so he can have the only game in town (as Tubby did in Saskatoon), who buys newspapers and cavalierly fires most of the staff thereby depriving them of their livelyhood, who uses the newspapers he owns to push his own right-wing brand of cultural imperialism (like claiming that Augusto Pinochet is a pillar of democracy), and who uses his paper for a forum for all sorts of nut-cases (like the judge from Alberta who last week went into a snit because the Supreme Court overturned his wrong-headed ruling on a sexual assault case, and used the Posts' letters forums to personally attack a female Supreme Court Justice - needless to say, he's toast), and who has personally threatened to horsewhip a female journalist for daring to expose one of his friends as a low-life crook in one of her books....

Here is what a competitor is saying about the imac
>success. From...the Jihad 'Chunks' what will he come up to counter the
>Montreal Gazette. Another loony right wing nut running it..

plenty. Read the thread "Canadian Stores Full Of iMacs, TiFKAS Full

Of It!", for the results of my OWN research....

>
> even the latest pride and joy : the Yosemite motherboard is nothing

Motorola developed the 68k chips not Apple. Apple had a hand in the PPC design.. And thats bad? What is wrong with ATI Rage 128? Apple used radius and other third party devices in previous products...Or is this just spilled milk?

> more then a adapted ASUS motherboard...

Umm, the Calamus web site has plenty of upgrades to handle professional needs.
Quite a few from just the beginning of this year.
-1

Can't Kinkos read postscript?

-2

What will be the third strike?

My experience with Kinkos. They have outdated machines. I needed to print an
image I scanned on my Falcon. Simple gray scale. File size was about 28 megs.
The print was to be 36"*12". I brought in my own removable with the file and
connected to the powersludge. It took the Mac an ungodly amount of time even
load the image. Printing took over 30 minutes to some high dollar laser
printer. Rotating the image on the Mac was out of the question as I was
paying by the minute. What a joke. The employee let me go without a charge
and said that they will soon update to Pentiums for jobs that require more
power.

->
->Peter S.

Absolutely right. Better late than never. Unlike a certain bloated,
resource hungry Mac OS that still doesn't do pre-emptive multitasking.
How late are you on that, Sin-baby? ;-))))

Bet you are just chewing nails at the thought of a resource friendly OS
like TOS/MiNT running on the PowerPC platform... Hehehehehe.... ;-)))

I don't think I mentioned Calamus at all - never used it - I use
Pagestream which is simple, easy to use, and handles my work at a
service bureau just fine - too bad there's no Mac version !

The Canadian Curmudgeon (who loves Atari software, but whose ST is
getting flakier by the day in Calgary)

CHAT ONLINE *LIVE* WITH ALAN CAMPBELL: YEAR 2000 CONSULTANT

Saturday, March 6th 8:00 pm (Central Standard Time... USA)

We invite Alan Campbell to join us to discuss the Year 2000 and how it will really impact us.

His knowledge of this topic sterms from long term preparation efforts and has been working with top level individuals at U.S. forms about what they can do about it. It will be a very good, informative night.

Find out what is going to happen. Find out what you, the computing user, cannot do without. Find out what the real risks are.

You can ask questions and get answers direct from Alan Saturday Night at 8:00 PM Central Time.

Do you know what your bank will do? Your investments? Your 401K? Your sewage line?

Do you know which dates OTHER than Dec 31, 1999 are endangered? Are you sure?

We won't miss it! Please be there with us online.

HOW DO YOU GET THERE?

Browse to www.AtariUsers.com and enter the main chat room.

You are then able to choose frames or no-frames. This site has been made as CAB friendly as possible. Atari CAB users should use the no-frames link that appears.

This site has also been tested with the common PC browsers and Macintosh Netscape 3.0. While this is a service to the Atari community, others are welcome.

Log in and say hi to whoever is online at the time. Remember that the only scheduled chats are currently Sat. 8:00 pm CST.

This is a big event with a Y2K consulatant is is used to speaking to large gatherings of people. Make it a point to show Alan Campbell a harty Atari welcome!

Ataris in North America were OFTEN sold out. This of course lead to their downfall as they couldn't supply them fast enough when it was very crucial. Selling out isn't always good. Early on STs were diverted to the STrongest market which was Europe. Leaving a less than suitable installed base in North America.

If I couldn't sell a computer for ONE MONTH, I would be right ticked off. A customer (Unless a Mac Jihad) wouldn't wait a month, they would go and buy a PC with MS windows INSTEAD.

Of course a hoard of non moving inventory is not acceptable either, but I can say Atari never had this problem, it was always the opposite.

Of course a few years back wasn't the Mac Classic one of the best sellers? Doesn't say much really does it? Other than there is one born every minute.

You are KIDDING RIGHT? The MONTREAL GAZETTE would waste all this space below
reporting about colour cases?
Well perhaps the English reporters in French Canada have gone a little soft
in the
head.

I did a little test to check this on my 6100/60. First I created a 10800x3600
8- bit grayscale image (~40MB) and openned it in Graphics Converter. Time to
load was about 10 seconds. Then I rotated it which took about 2 seconds. What
type of computer and software were you using?

```
AIRC, it was something simular. An older Power Mac. But I do remember the
application. PhotoShop. What a turd. BTW, the file was a TIFF, and not an
8-bit image as I first recalled (it was 24bpp). Stick that in you pipe and
see what results you get. Using Graphics Converter is cheating however:).
It's a nice app, full of features. Wish there was a port:).

What
> > type of computer and software were you using?
>
> AIRC, it was something simular. An older Power Mac.

I have the oldest and slowest of the Power Macs so the one that you tried it
on can't be any slower.

> But I do remember the
> application. PhotoShop. What a turd.

Photoshop is a big resource hog. You should only use it on a fast computer
with a lot of RAM. Finding the slowest Mac program to do the job isn't a
terribly good way to demonstrate that the Mac itself is slow.

> BTW, the file was a TIFF, and not an
> 8-bit image as I first recalled (it was 24bpp). Stick that in you pipe and
> see what results you get.

Except for loading, it should be faster since there would be less actual data
to transform due to the overhead in representing the image as a TIFF. I can
actually try it later if you give me the exact size of the image in pixels.
BTW, why would you represent your image at 24bpp? The human eye cannot
differentiate between 16,777,216 shades of gray. The American College of
Radiology and the National Equipment Manufacturers Association have decided
that diagnostic X-rays only need to be 12bpp.

I don't use it. I use Photoline. But it is what Kinkos had to utilize. This didn't start out as Mac abuse. Mr. Sincrap stated that Kinkos had problems reading files created on Calamus. It is Kinkos that is lacking in the area of support here, not Calamus.

Are you a school teacher?.........

The image was scanned for printing, not viewing.
Do you need an explanation why you would want an image scanned at 24bpp for printer output?

I hope not.

Kinkos does suck but if they are doing the printing then you will have to
provide your content in a format that they will accept. If you feel
confident, you can always bring postscript files. I've had to readjust my
content at Kinkos because the print didn't look right. That would have been
problematic if I had been using Calamus.

> Are you a school teacher?.........

Nope, I'm a software developer who works in the medical field. I just gave an
example of a type of image that must be very detailed and can be adaquately
represented using 4096 shades of gray. That's why I was wondering why you felt
that you needed 16,777,216 shades of gray.

Actually, I do. BTW, by "scanned" do you mean "represented"?

Big Difference...Apple supplies great numbers worldwide. Half of Apple's sales are international while Atari had an uneven sales pie like 85% were international and 15% demoestic. Apple is shipping large quantities to the market, but according to the press is that their warehouse is empty and replenishment will be slow in comming.

> If I couldn't sell a computer for ONE MONTH, I would be right ticked off.
> A customer (Unless a Mac Jihad) wouldn't wait a month, they would go and

The Jihad 'Chunks' needs a net lesson in inventory...According to the press
articles, Apple's warehouse is empty and will remain that way until April.
Which means what you see as far as iMacs are concerned are it for the month.
It's only the seventh day of this month with three weeks to go.

If I was a dealer and had hypothitical monthly iMAC sell through of 125 units
a month and had only 50 units on hand for the month, I am screwed. Which
means I am negative 75 units lost or hopefully paid backorders with
understanding customers. But at least I will have the G3 pro line and PB's
in plenty hypothicaly...

1. Your imaginary friend "Chunks" does not exist, TiFKAS. Neither

are there any "Atari Jihads".

2. The Montreal Gazette can't do that sort of thing, only the consortium that owns it, Quebecor, which ironically enough DID buy the Toronto Sun chain and let go some of the staff. But that was a much-needed housecleaning - and ironically was something the Sun wasn't expecting, as they had been championing Quebecor as their saviour from a similar hostile takeover from the Toronto Star group. Just desserts in this case.

3) as for the article - I respect the Montreal Gazette, but really, there are more than two Apple stores in Montreal. I'm sure calling them all and seeing what inventory there are would have shown a very different picture.

>

nope, it's called "doing my homework" and "questioning authority". Since you, TiFKAS, are a notoriously unreliable source, and an even worse troll, and since the National Pest is considered having no journalistic credibility, I thought it best to do what either one of you failed to do and check up on actual supply at the stores.

TAF is in stable and capable hands under Ken Macdonald as well as the rest of the TAF executive. I'm currently looking at several offers from a number of interesting companies for furthering myself.

BTW, the syntax of the above paragraph is lousy, and you mispelled TAF. I'm sure you were knocking back a few when you replied to my missive.

Quit crying over spilled milk - it won't get you anywhere.....

there's only 416 and 905. Surely anyone with the full 24 ounces of cranial matter would check the front of the phone book and confirm that. Oh I forgot, you only now have 4 ozs after your brain was fried by the Steve Jobs Reality-Distortion Field� - which makes you a true Quarter-Pounder person :)

>
>>   - Computer City, Etobicoke: they had a large number of the iMacs in
>> stock - and in all five colours.
>
>And what was that number?

number is irrelevant - what was confirmed in my conversation with the clerk was that 1) they have all five colours in stock, and b) they had stock. The claim was made that iMacs were hard to find in Canada - and I am disproving it.

Again, quit crying over spilled milk, TiFKAS - I'm sure that Mummy will pick up your bottle and hand it back to you.....

>The Jihad 'Chunks' needs a net lesson in inventory...According to the press
>articles, Apple's warehouse is empty and will remain that way until April.
>Which means what you see as far as iMacs are concerned are it for the month.
>It's only the seventh day of this month with three weeks to go.

and again, the claim was made that iMacs were "hard to find" and "sold out all over Canada" at the time of writing - which my phone calls have proven that is not the case - indeed, there are STILL dealers that have the original Rev Bs in stock, and are desperately trying to get rid of them. Care to spin and damage-control THAT aspect of my findings?. You need a lesson in journalistic ethics - of course, the "ethics" part has been a stumbling block for you.

want more milk, baby?
>
>If I was a dealer and had hypothitical monthly iMAC sell through of 125 units
>a month and had only 50 units on hand for the month, I am screwed. Which
>means I am negative 75 units lost or hopefully paid backorders with
>understanding customers. But at least I will have the G3 pro line and PB's
>in plenty hypothicaly...

ah, yes, the Powerbook. Certainly a great success - which is why Apple recently dropped the price to 1999 USD, obstenably to clear all the units gathering dust. Why they're so desperate they're giving them to even their most clueless "Power Reps" who are too cheap to buy their own, more powerful personal systems....

No Cheezy Poofs for you until you finish your strained spinach, Junior....

In what way Macs cost a lot? Well, figure this out. If you compare the
iMac with PC's of the same price, by using decent benchmarking
software or apps that is, the facts will speak for themselves. I know
my 1000$ PC easily outperforms the 1199$ iMac, do you?

Beleive me, I've been working with Macs, I have surfed the webb. I've
also worked as a reseller, repairman and supportsperson. Have you?

To get more on topic, I also know an Atari Falcon 030 outperforms a
Mac SE/30 ...

Problem is, when presented with the facts, TiFKAS claims that all the tests are biased and that PC Magazines who do the tests fudge their results in order to protect their "vested interests" (as opposed to their interests that wear 3-piece suits ?) beacause they're afraid of the iMac (when in truth the tests were done because they felt Jobs was trying to use another Reality-Distortion Field� in puffing up the iMac and decided they knew a challenge when they saw one). Very funny, when you consider that while the iMac did sell 800,000 units, over the same period the PC manufacturers sold 40,000,000 PCs combined.

And it also appears that TiFKAS is still perpetuating the myth that the iMacs are "all sold out", when in reality it's the fact that Apple has no iMacs in their warehouse because they shipped them to their dealers. My own research has shown otherwise - plenty of iMacs in the stores in Toronto (including Rev Bs that the shop owners are desperately trying to sell off with rebates), and I would suspect the issue to be just about the same all about the country. This is where the market is speaking loud and clear, but TiFKAS is still shoving parsley in his ears to try to keep out the truth.

And if the iMac is REALLY doing so well in the States, then why are a number of Best Buys (which had only recently come on board again regarding Apple) now dismantling their displays and selling off their remaining stock dirt cheap? I notice that when I mentioned them in this report that TiFKAS never bothered to refute this - perhaps the little weinerhead knows what's really going on?

>

>>and compare to Atari web sites run of of Peecees....

so TiFKAS now claims that there are more Mac sites than Atari
sites? I'd say they'd be roughly equal - in fact, check out my page of
links at http://webhome.idirect.com/~dreibel/yecprohardware/links.htm
and you'll find a whole slew of sites dedicated to Atari.

And, oh yes, the Apple website, (http://www.apple.com) which last
time I looked wasn't even hosted on a Mac, but some sort of PC. Guess
that won't happen until they get the bugs out of the now-delayed MacOSX
Server - I wouldn't blame Steve Jobs about this, especially after his
complete humiliation at MacWorld Tokyo that led to another one of his
infamous hissy fits. Can't wait for TiFKAS' damage-control on this
(guess he'll pull out another categorical denial from Mr. Crawford that
the incident never happened)......

Why always catching up...why not be the first for once? Deja is here and the
future as a portal. I find the newsreaders obsolete and very limiting. Also
the Usenet feeds through earthlink is rather limiting. I prefer the portal
route with my personal channel..

Why has not intel disputed the Byte tests? The tests done by the PC rags have
been disputed and were fudged..

The truth hurts does it?

Apple is sold out at the warehouse according to the Montreal gazzette indicating higher sales than anticipated.

What are they going to tell you on the phone. I have no doubt that they currently have plenty ...but remember no replenishment until April.. Call next week and get a physical count of the inventory.

According to Computer Retail Week, Best Buy will recieve first Yums in May when a new iMac planogram is formalized. The current planogram could not support 5 Yum's. Thats why there has been dismantling once the Rev B's are sold.

I stated that the warehouse is empty with no replenishment until April. Big
difference.. If they can't get rid of Rev B's send down south and will be
gone in two days..

Ducking the issue here. At least we have a below $2000 PB to make up for low
iMacs...

When will there be a TOS laptop? Year 2003?

Why would I need a second PB for? When I got the PB 3400 at the time, I stopped using my Performa 6200 and sold it to a School Teacher.

I don't recall seeing a "130XEGM" anywhere. How does it relate to the
more common 130 XE?

Likewise, what is the "Touch Me"? The fact that you've listed it amongst
the games systems leads me to think it is one, but I dont recall seeing it.

What a dedicated jihad..

So why do you not use the ST for online?

The comparison is very fair. The Milan and Hades are available today.. Are
you stating that the milan is not upto par to the imac? It's not Apple's
fault that the 68k Tos clones have not kept up technology wise...

Except for one previous G3 beige Tower, Apple has never shipped a modem with
the retail Pro config machines...This goes back to the pre G3 line such as
the 8600, 9600, 9500, 7500 etc...The vast majority of these machines are
hooked in corp networks were modems are not used.. Not say I agree with
Apple's modem approach..

> Next day comes in customer #2 (now Saturday). This person asks pretty much

> I provide that Apple SAYS they are going to release the modem soon.

The Blue G3 modems are available from the Apple store for $100 and soon from Comp for about the same price..The $300 price may not be accurate unless you send back the defective unit were a rebate is applied..

> By Monday, Apple announces the part number. (Would it have been too big a deal for the Apple person to tell me that they were coming out in 2 days - or am I really to believe that Reseller Support doesn't know product availability that close to release?) Every customer who comes in this week and talks to me about the machine is told that the modems are coming, and I even provide them the Apple part # (M7405LL/A, if you're interested). I also advise that they order one via Apple, as it may get to them sooner than if they wait for the to get to the stores.

Check again...there is a retail skuu#

> Customer #2 comes back. I know (as he does) that he wants the machine, and I can now tell him that the modems are coming. No apology - still pissed that we don't have them in stock.

What can you do...It's a thorny issue and can't go farther than that..By next month all will be forgotten as other vendors enter the G3 market..

> OK... so now the machine is sold. The customer wants memory. I'm not sure about any of you, but iMac RAM, IMHO, is goofy. Manufacturers who make it don't even follow a specific standard when it comes to total dimensions, and this is a problem when there isn't the same wiggle room on the bottom iMac slot that there is on the top. So I've had to turn away several customers because we don't have the right SIZE of the right RAM. As for Yosemite, PC100 was supposed to be common. But, and I know this doesn't have to do too much with Apple, there aren't any PC100 128 or 256MB chips in our store. I had a customer as for a 1/2GB of RAM upgrade and I couldn't give it to him.

Yep....it's common...Comp does not usually stock the higher memory upgrades due to cost...There is always MacWarehouse which typically turns over memory much quicker..

> So anyway, we also don't have any of the bezels for Zip drives and we sure as heck don't have any DVD drives or modems yet. So we turn people away - and the customer isn't mad at Apple - they're mad at CompUSA.

The only thing you can do is get them on the G3/350 with zip and go from there. I doubt you will see a aftermarket DVD kit from Apple at retail...

> What can we do about this?

Pray..

> BTW, we only yesterday received any of the USB mice, keyboards and joysticks that have been on the market for a few months now. Additionally, we've never carried the iPrint, uSCSI or any of the other adapters necessary to connect

It's a little bit faster than the TNT, about 20%, with preliminary
drivers. Should be faster once "real" drivers are in place.

My, what an idiotic remark! MacOS X is so much more than MagiC... And that $995 price includes some serious business/enterprise software. Oh, and let's not forget Net booting too. I don't believe MagiC has TCP/IP built-in, let alone Net booting...

MacOS is a lame excuse for an OS, and you know it. That is the only reason
you post here, because you know full well that neither the Milan or Hades
has the same development budget as Apple has, and so can't compete on the
technological level directly with the big boys.

Meanwhile, you are flaming Atari users for using older but nonetheless very
capable technology whilst _you_ are still waiting for Apple to provide you
with a decent PMT OS. Don't you think that your attitude is somewhat
hypocritical?.

Truth is, any modern PC shits on the iMac in every way, but it's easier to
come into an Atari newsgroup and flame rather then face Apple's shortfalls
isn't it?.

Wow, a 14" screen powerbook. Why not just take a Lynx with you when your out? Only 64MB of RAM. My antique Falcon has 78MB, 10G's, 56K at 230K DTE and S-Video is only a $1.00 dollar part. MC1377P. You should try installing one yourself sometime. You will wonder why apple charged you so much for it. Why don't you retire that hand-me-down machine you have for something that has the horsepower to pull Mac O/S 8 around at a decent speed?

Mr. Sinclair,
     Like a poor marksman , you keep missing the target. I do use my Mega Ste
with CAB
on the internet. I chose the machine to use based on how I feel that day. I began
logging on to the internet when it was still called DARPANET. I have connected
with IBM
350's, T/I 99/4a's, Atari 800XL's, Interact model R's and even a Tandy Model 1,
Unlike
you I do not need the latest colour machine to log online. Nor am I forced to
utilize
ever increasing funds to do so.

Harold Alley
PS when I attended college in the early 80's (while you were drooling over your
formula) I used all of those machines as a Computer Science major.

By the way thank the inventor of USB . His name in Nolan Bushnell, He invented

Atari and placed the SIO port on his EIGHT bit computers nearly 20 years before the PC and Mac worlds figured out how to daisy chain peripherals.

Actually Mr. Sinclair I was referring to the PC world. A true professional uses cards based around the Glint, Gloria, Delta, and Razor chip sets. The Mark of a TRUE graphics professional is use of the HEIDI standard coupled with OpenGL. All of these cards

are
available starting at around $1,100.00. For the PC. the Delta and Glint MX are my
favourites. Both offer 1920 x 1080 in 32 bit colour for starter. the Glint MX can
go as
high as 2750 x 1880 in 16 bit colour. And the card on needs 16 Megs of ram to
accomplish
this. Try that on an iMac little man!

When going to war know your opponent, or stay at home.

Actually, being an Encarta subscriber, the content is moving to the web.
No big deal really. It certainly has nothing to do with the ever growing
base of those wonderful little machines.

In fact, Microsoft's current lineup of Mac software represent some of
their best work in years. Let's see, oh that's right--they did do an
Atari hack of Write back in 1986....I actually have the brochure as part
of my Atari collection.

C'mon Harold, give up on the Apple bashing. It's over, man. Apple is

still around (and thriving!), what's left of Atari is owned by a
clueless toy manufacturer.

Besides, the whole world knows that Linux on a PowerPC is what rules. :)

John

I certainly have heard of MiNT, but I have never seen/used it. I don't recall; does it support a GUI, or is it strictly command line? Have you compiled any software for it?

and may I add - there's two projects coming from Titan/BSS that will allow Falcon owners to use the ATI Rage 128 card. I'm certainly interested in the Tempest Coldfire accelerator/PCI slot version myself...

And as usual in my absence, TiFKAS (The iDiot Forever Known As Sinclap) has been at his usual raging foaming-at-the-mouth paranoia in attacking the imaginary "Atari Jihads" who are "out to get him" and his Macs (a fine computer, BTW, which unfortunately due to TiFKAS' obsessive personality many Atarians may never want to check out simply just to spite him!)

Hey. Yes, it does support GUI's. The best alternative desktop to run with it is Thing. You have GUI support with the Thing desktop as well as "virtual consoles" that are command line only. <alt><F1 - F9> give you these desktops. You could theoretically be running 9 differetn apps from each Vconsole, memory and CPU willing. Quite a bit of software from the Unix world has been ported/compiled to run under Mint. For example, a version of ICQ called MICQ runs fine. (check my .SIG for my ICQ number).

If you would like, I can send you a .JPG or .BMP of my desktop. If I send it UUencoded, its just slightly under 700K. Let me know if you want it! ;-)

Catch ya alter...

John
At least Atari NEVER took money from Microsoft just to stay solvent. I myself would rather go bankrupt than to be forced to grovel at the feet of Bill Gates. Of course the Tramiels should burn for what they did to Atari.......

Harold

I'll tell you something else... years before MagiCMac was released,
Multi TOS was ported to the Apple... Making it the first true
multitasking OS on a Apple....

In 1992, Apple computers were powered by 68030's and that made MinT
a bit sluggish, but on a more recent Apple it flies...

If You like I'll track a copy down and send it to you, Mint is still
freeware

Monday 22 feb '99 TIFKAS commented stupidly;

>It's not Apple's
>fault that the 68k Tos clones have not kept up technology wise...

It sure isn't, but what has Apple donated to the world the last few
years? There's no Apple technology inside the modern Apples...
The G3 is developed and produced by Motorola, USB and Firewire are
no inventions of Apple, the graphic output is handled by a custom
ATI PC card. Take a look inside Your precious Mac and take a look at
a PC, what's the difference except for the processor ? NONE, Apple
computers have become PC Clones...
All that is left is a flashy box, and a bulkish and very sluggish not
to mention buggy OS, which except for a few bells and whistles hasn't changed for
years, System 7, 7.5, 8.0 it's still the same crap...they
make you pay for, it can still NOT do real multitasking -))
Think different => means buy a PC Clone in a flashy box with a Apple
logo sticked on it and pay a lot for the hype....

The last REAL computer Apple made was the QUADRA 840, all the shit that
came later is probably recycled by now. Where's the 5200,6200,7500,8100,
etc........ what poor misleaded soul is still slaving away at those

"marvels"?

IMHO Apple is going the same way as Atari & Commodore => DOWN.
It wont be long now, the patient is already in a deep coma, I'll be at
the funural, will You ?

Cheers from Belgium (Land of the Jihads)

Actually, Apple invented and holds the patent for firewire. The sound hardware
and motherboard were designed by Apple. So were the keyboard, mouse and case.
But even if your statement that there is no Apple [hardware] techology in
modern Apples were true (which it isn't), what would it matter?

Apple has developed a fair bit of software technology over the last few years.
They have significantly enhanced AppleScript, QuickTime, WebObjects and
YellowBox. They created ColorSync, Quickdraw 3D, Sherlock and Mac OS X Server.

That would be really interesting to play with. Please do!

John

well, TiFKAS, it looks like many Mac users disagree with you - as usual.

Judging by the reaction from users of the iCAB demo on comp.sys.mac.advocacy, they're quite pleased with how well iCAB works - not a pig in memory or in hard drive space, speedy, not bogged down with nonsense, etc.

Of course, you wouldn't know that, since you're too scared to venture into mac.advocacy - could it be that you'd be rendered to french fries in seconds the first time you posted your drivel there...

BTW, next release of the iCAB demo will be in English as well as German.

And as for "sticking to the past" - well, it seems there's work going on an .mp3 player for the Falcon that should be out pretty soon. We may be a bit behind, but it's fun to play catchup to show up just how wrong mouth-breathing disinformationists like you can be in your desperate attempts at brinksmanship over obviously superior debaters...

Hi Daniel! Just thought I'd mention that if you are using MiNT on a Falcon with an FPU and at least a 68040 processor, you can play MP3's *now*... ;-)

PS Keep up the good (Anti-Sinclair) work! ;-)))

Nah, this is only a baby one.

There was a couple of OS religion threads back in 1989 - 1991 (mainly Amiga vs PC vs Mac) that went on for more than a year. The Atari camp also briefly chimed in for a couple of months, but they were hammered by everyone because of their inferior platform.

news://news.soundblaster.com/creative.products.sound_blaster.live also has some ridiculous threads that just don't seem to go away, but even those are nothing when compared to the good old Amiga advocacy threads ;-) Although, the SoundBlaster camp are much better at swearing and abusing each other.

Oh, and while we are at it, if you are trying to keep the thread going, you ought to add more groups when cross-posting and also follow up your own posts with faked headers and troll :-)

The Pentium III id is great for software publishers that want a continuous flow of income. One of my ex-employers said they will only support the P-III in their latest release of their high end graphics software. Each customer will have to enable the CPU id so that they can monitor how many CPU's they run and charge a per CPU licence accordingly.

What they eventually want to do is make their customers pay for the CPU-hours they use. The customer will pay each month depending on how many CPUs they used, at what speed and for how long. Until now, they could not do that reliably, but with the P-III they can just force their customers to do it. The clients will still have to purchase their own hardware, but the software is now pay per use.

They reckon that the continuous flow of money from the software has potential to pay for ongoing development. Even if they decide to stop development, many clients will still pay for years to come - easy money.

Eh, Beavis..
Apple has been involved with the PowerPC..including the Generation 3 processor
which is optimized for 8...

Apple invented the FireWire technology as well as the tech in OS 8.5 like
Sherlock, Quicktime and the best USB implemintation..Also having developing
Yum casings are original..

You need to take your head out of your arse and smell the weeds... System 8.5 is marvelous...And will you get a modern original OS instead of keeping back?

> The last REAL computer Apple made was the QUADRA 840, all the shit that came later is probably recycled by now. Where's the 5200,6200,7500,8100, etc........ what poor misleaded soul is still slaving away at those "marvels"?

?

> IMHO Apple is going the same way as Atari & Commodore => DOWN.
> It wont be long now, the patient is already in a deep coma, I'll be at the funural, will You ?

You sure...

- Apple has achieved 5 straight profitable quarters (FQ1'98 $47M, FQ2 '98 $55M, FQ3 '98 $101M, FQ4 '98 $106M, FQ1 '99 $152M)

- Apple posted a FY '99 Q1 net profit of $152M, or $.95 EPS, compared to $47M and $.33 EPS in the year ago quarter

- Apple's FY '99 Q1 revenue of $1.7B was up 8% from the year ago quarter

- Apple sold 944,000 units in FY '99 Q1, a huge gain over FY '98 Q1 total of 635,000

- Apple sold over 519,000 iMac computers alone in FY ' 99 Q1, and has sold nearly 1,000,000 iMac systems since 8/14/98

- Apple's overall unit growth was 49% year over year

- Apple unit growth currently outpaces the industry average by 3x to 4x (variability results from different market tracking sources)

- Apple currently has over $2.6B in cash reserves and is generating over $200M more per quarter

- Apple's FY '99 Q1 gross margin of 28.2% was up from 22.4% in the year ago quarter

- Apple exited FY '99 Q1 with only 2 days of inventory ($25M), besting industry-leading Dell's 7 days of inventory

- 45% of U.S. iMac purchasers are new to the Macintosh platform (first time buyers 32%, Windows "converts" 13%)

- 62% of Japanese iMac purchasers are new to the Macintosh platform (first time buyers 46%, Windows "converts" 16%)

- iMac was the number 1 selling computer October - December through retail and mail order channels (source: PC Data)

- The Mac OS is one of only two high-volume operating systems on the face of the planet

- Over 12,000 3rd party products have been developed for the Macintosh

- Over 1,600 new Macintosh software titles have shipped worldwide since the iMac was introduced last May

- Apple's QuickTime multimedia technology is the de facto standard for both Macintosh and Windows

- Over 25,000,000 Macintosh users have installed QuickTime on their systems

- Over 50,000,000 Windows users have installed QuickTime on their systems

- 11,500 CD-ROM titles and hundreds of DVD titles have been authored with QuickTime

- The G3 processor in every Power Macintosh is at least twice as fast as it's Pentium II or III counterpart (Source: BYTEmark tests)

- A Pentium II would have to run at 800MHz to equal the performance of a 400MHz G3 (Source: BYTEmark tests)

- By tightly integrating hardware and system software Apple still delivers the easiest to set-up and use personal computer

- 62% of creative professionals use Macintosh

- 76% of color publishing is done on Macintosh

- 72% of multimedia CD production is done on Macintosh

- 65% of digital video and multimedia production is one on Macintosh

- 64% of Internet Web site content is created on Macintosh
- Overall 47% of HTML and Web publishing is done on Macintosh

- Apple has a 52% installed base share of the U.S. K-12 education market

So who is going to pay for iCab when the others are free?  Still is buggy and
I need a dependable browser to get the job done.  Once iCab is stable...rock
solid..I may try out...Who knows...maybe i can expense the cost...-)

Me. I'm tired of fat, ugly browsers from Microsoft and Netscape. $30 (the rumored retail price) is pretty trivial.

> Still is buggy and
> I need a dependable browser to get the job done.

It's a preview release. Give them a month or two to get rid of the more obvious bugs (as opposed to Explorer and Communicator, which are both still buggy after all these years).

Coming from you, that is almost a submission that the machine is inferior.
Why again, tote around a pile that that? Why not just purchase your own and
write it off on your taxes. Surely with your income you need some tax
advantages?

Exactly what browser do you use that is rock solid?  I have used them all,
and I have not found one that could not be crashed even on windows.

iMac is a marketing success, however it's sales are still small compared to
overall PC sales!

...Hook...Line...And...Sinker! -0----; :-D

This is marketing "crap" I'm afraid. The BYTEmark test is _not_ a good measure
of processor performance, since it varies greatly on the compiler used and the
optimisations choosen (Apple conveniently fail to mention this!).

The results quoted by Apple are G3 optimised results against 486!!! optimised
results (when running on the Pentium)! When the same test was re-compiled

using Pentium optimisations, it so-called 'toasts' the G3.

Please read the following related link;

http://www.zdnet.com/zdtv/freshgear/viewpoints/story/0,3679,2132167,00.html

The G3 processor is just as good as, but not better than, the equivalent Pentium II processor. It is slightly faster than the Pentium II for integer operations, but slighy _slower_ for floating-point operations. In otherwords, overall performance is about the same. Application benchmarks tend to reflect this, where performance differences are more to do with software optimisations and design rather than processor power.

Please read the following benchmark results;

http://www.zdnet.com/pcmag/firstlooks/9808/f980828a.html

> - By tightly integrating hardware and system software Apple still delivers
> the easiest to set-up and use personal computer

Can't argue with that! :-)

> - 62% of creative professionals use Macintosh
> - 76% of color publishing is done on Macintosh
> - 72% of multimedia CD production is done on Macintosh
> - 65% of digital video and multimedia production is one on Macintosh
> - 64% of Internet Web site content is created on Macintosh
> - Overall 47% of HTML and Web publishing is done on Macintosh
> - Apple has a 52% installed base share of the U.S. K-12 education market

Yes, the Macintosh has established a very strong position in a number of market areas over the years, however, the rest is dominated by the PC, and the 'wonderful' iMac isn't the machine to change this situation! But who knows what suprises Steve Jobs has in store for the future! :-)

Should be very interesting!

(Back to my PC for now! :-D)

BTW, where did you get your results from? Are the URLs available?

:)
Dr Yassam

>Same feature set?
>Or shades of feature less Calamus?

    so far the features on iCAB have proven to be what Mac users want,
not what IE and Netscape have decided what's "good for them". And so
far, at least one Mac journalist has been raving about just how good
and fast iCAB has been to him.

    And as for your views on Calamus SL - well, seeing as you've
admitted you've never used the program yourself, that makes your
opinions worthless. (And speaking of comparing Apples to oranges,
you're comparing a web browser to a professional DTP package?)

    Coming from a "man" who has proven time and again he's a pro at
keeping his head buried "up there" so often there are sphincter marks
on his neck. Now that is real pot/kettle/black there,
TiFKAS.

    Ah yes, 8.5 - the operating system noted in its initial release for
trashing hard drives. Shurely shome mishtake in Apple's development
department that they should've thorughly squashed before release.

    We've already got some nice OSes that give bloated buggy
```

abominations like 8.5 a nice run for their money - and take up less system resources.....

>- Over 12,000 3rd party products have been developed for the Macintosh
>
>- Over 1,600 new Macintosh software titles have shipped worldwide since the

The T1 at the Hilton Garden INN is awesome...Does any TOS notebooks have
ethernet or will soon?

Not for long.  Will be an avalanche of USB products in the comming days,
weeks and months.  These products will include HD's, scanners, flightsticks,
drawing tablets, printers and so on...Just plug in and don't worry about it.
When will TOS boxes migrate to USB, FireWire and ATI Rage 128?

No issue here...The Apple midi guru stated that the common drivers are
here..Very nice USB-Midi demonstartion.  Power with out the price....

>     They have MIDI demonstrations at Bellevue Mental Hospital? :)

Why not call them...They had at Infinite Loop 4..

Apple has released several preemptive multitasking operating systems throughout the years. The first was used in the Lisa, then A/UX, then MkLinux and finally Mac OS X Server.

Actually, SCSI is quite old. Modern SCSI systems are still quite fast but you
can only have 7 devices per controller, it requires termination, it's not hot
pluggable, you have to set device IDs, it doesn't allow branching, the
connector is quite large and a computer is required for data transfer.

But where speed is the prime consideration, SCSI is still the only viable
option.

Regards,

Clockmeister.

Well, maybe I should do some reading before jumping in, but exactly how fast of data transfer can one expect with a USB device? 20mb/sec? 10mb/sec? 2mb/sec?

Seven devices per controller is more than most need, and considering the data integrity that SCSI provides, arbitration features (can USB handle machine/hardware arbitration?), and IS hot pluggable with the proper connection (aka Power Plug for Mac), ID's on new drives can be set with software, a connector the size of a Mac video connector, SGI and HP use SCSI for all their high end work stations, I think you may have just floundered......

BTW, this is the second time I have documented how SCSI devices are hot pluggable to you, Brian. Please cross than one off your list:).

Let me know when you can connect a Barracuda to your USB port.

MG

You don't think that the 400Mb/s sustained transfer rate offered by firewire
is fast enough?

USB is 12Mb/s in high-speed mode. I believe that Peter refered to USB and firewire. Firewire has a sustained speed of 400Mb/s.

> Seven devices per controller is more than most need,

Most people don't need a lot. Apple has sold a lot of computers with multiple SCSI connectors (8500, 8600, 9500, 9600, etc.) and a lot of graphics professionals have added additional SCSI cards to their Macs even though the computer came with one.

[snipped]

> SGI and HP use SCSI
> for all their high end work stations, I think you may have just

SGI also offers fiber channel as a higher speed connection.

> BTW, this is the second time I have documented how SCSI devices are hot

SCSI can be made to be hot pluggable but you need hardware to do this. With USB and firewire, no extra hardware is needed. I also believe that you need extra hardware for each device that you hot plug but I could be wrong.

> Let me know when you can connect a Barracuda to your USB port.

You can already but why would you want to? OTOH, you could have four Barracuda ST39173W/LW drives and still not saturate firewire.

Hmm...does that include the specs from the latest SCSI standards? Just
curious! ;-)

Looked into it today. Pretty impressive stuff.

Yea, it's not that big of an expense. There are a lot of compatible SCSI
devices out there.

No, your right. A power plug for each device. But now your being specifc:).

Are there firewire hard disk controllers built in now?

Firewire comes built-in with Apple's pro desktop line and the Sony Velo line. You can also buy PCI firewire cards from several vendors. The Adaptec HotConnect 8920 is $299. I believe that someone has a 200Mb/s card for $200 (Pinacle?).

there is NO colour synching on the atari, or the IBM(windoze), just the
mac has coloursynching. :-(

: throughout the years. The first was used in the Lisa, then A/UX, then MkLinux
: and finally Mac OS X Server.

yeh right. _everyone_ runs a server on their machine. give us a break.
we are talking about a fast efficient multitasking system in everyday use

such as three systems that can be called such on the atari: 1)geneva,
2)MiNT, 3)MagiC and the amiga. I am not sure windoze can be called fast
and efficient, but it at least multitasks, unlike the mac.
try MagiCmac if you want to see fast efficient multitasking on a mac.
you WILL be blown away!

Actually, there are color synching systems for Windows. The problem is that
that it is not a system-wide service so you lose all the color synching data
on export and it is inconsistent between applications.

The original statement was "And all with true pre-emptive multitasking, which Apple's OS still hasn't accomplished after all these years". I was pointing out that Apple has created preemptive multitasking systems. Actually, they created a preemptive multitasking system (Lisa) before Atari and Amiga did. Also, a lot of people are using Linux on their workstations. I'd bet that there are more Linux workstation deployments than Geneva, MiNT, MagiC and Amiga OS deployments combined. Also the Mac can, of course, multitask. There are several operating systems that are available for the Mac and offer preemptive multitasking: A/UX, AIX, FreeBSD, MkLinux, LinuxPPC, BeOS, Mac OS X Server and MachTen. Have you used the BeOS? You should use the BeOS and MagiC side-by-side for a while.

hmmm - and all of those take up a large amount of hard drive and RAM space. don't they? Wheras the MagiC operating system takes up a minimum of two megabytes RAM and about the same hard drive space to install. Quite amazing when you consider the number of features that MagiC adds to an Atari (not to mention a Mac when using MagiCMac).

If you want to check out what MagiC is capable of, then I'd suggest checking out Bengy Collins' web site at http://bengy.atari.org (he even has a demo copy of MagiCMac online that you can check out for yourself).

As for MacOSX - gee, $995 US just to do something that a MagiC can do on an Atari for $99 US.....

I think that we all know that preemptive multitasking operating systems can fail in the marketplace. However, the Lisa operating system and hardware were excellent. The problem was that most people weren't willing to pay $15K for it. So Apple started making cheaper hardware and the operating system was redesigned to work in 64K ROM and 128K RAM.

Large is relative. Since Linux and the BeOS work nicely on <1K computers, I am not really worried about their "large" resource requirements.

I've used it before; I wasn't particularly impressed.

Mac OS X Server is, as the name implies, a server operating system. It offers clustering support, AppleShare IP, WebObjects, excellent development tools (IB/PB), a BSD 4.4 implementation (POSIX), the ability to netboot workstations, remote display, etc. For those features, it's not a bad price. And if price is a concern, you can always use Linux.

Not! Considering that the a Mac cpu comes standard with an average of 64M and
6G's..The whole issue of memory and HD is moot..

Comparing Apples to Oranges...Not even a centimeter close...Saw a demo of Mac
OS server last week...Impressive..

Sports fans...Whats wrong with this picture? Starting at $1599, the new G3/300 bondi-blue Tower is a bargain....USB, ATI-Rage 128 w/16megs vram and Firewire for low cost digital editing..The Milan according to the specs is stuck with the old and with a price to cry about..

Milan Specs Technical data overview:

Motorola MC 68040 CPU or Motorola MC 68060 CPU (available toward end of 1998) 4 standard PCI slots 3 standard ISA slots 2 IDE interfaces, busmaster-capable VME slot can be upgraded 4 SIMM slots for EDO RAM, max. 512 MB RAM 512 kB Flash-Eprom for operating system, software update possible Standard PC keyboard connection Battery- buffered real time clock 1 parallel port 1 MFP- compatible serial interface (up to 19,200 Baud) 1 PC- compatible serial interface (up to 230,600 Baud) 1.44 MB HD disk drive Base price (Midi tower housing, approx. 1 GB HD drive, 16 MB RAM, 2 MB S3 Trio V64+ graphic card, keyboard, mouse, Milan operating system and TOS 4.5, software bundle): DM 1499

PowerMac Blue G3

Processor

300-, 350-, or 400-MHz PowerPC G3 processor

512K or 1MB backside level 2 cache on processor, running at 150, 175, or 200 MHz depending on processor speed

100-MHz system bus

Integrated floating-point unit and 64K on-chip level 1 cache (32K for data and 32K for instruction)

Memory

64MB or 128MB of PC100 SDRAM (3.3-volt, unbuffered, 64-bit-wide, 168-pin, running at 100 MHz)

Four DIMM slots support up to 1GB of PC100 SDRAM using the following DIMMs:

�32MB, 64MB, or 128MB DIMMs (64-bit-wide, 64-Mbit technology)

�128MB or 256MB DIMMs (64-bit-wide, 128-Mbit technology)

Storage*

One of the following:

�6GB Ultra ATA hard disk

�12GB Ultra ATA hard disk

�9GB Ultra2 LVD SCSI hard disk with Ultra2 LVD SCSI PCI card

24x-speed (maximum) CD-ROM drive; or 5x-speed (maximum) DVD-ROM drive with DVD-Video playback (reads CD-ROMs at up to 32x speed)

Zip drive (some configurations)

Two additional expansion bays for Ultra Wide SCSI, Ultra2 LVD SCSI, ATA (IDE), Ultra ATA, or ATAPI drives (including CD-ROM, DVD-ROM, and Zip drives)

Interfaces

Connectivity

�Two 400-Mbps FireWire ports

�Two 12-Mbps Universal Serial Bus (USB) ports

�Apple Desktop Bus (ADB) port (maximum current draw for all ADB devices is 500 mA)

Communications
�Built-in 10/100BASE-T Ethernet
connector (RJ-45)
�Optional internal 56K modem card
(supports K56flex and V.90 standards)**
Expansion
�Four PCI slots: three 64-bit, 33-MHz
slots and one 32-bit, 66-MHz slot
dedicated to the ATI RAGE 128 graphics
card
Video
�15-pin mini D-Sub VGA connector and
Macintosh-to-VGA adapter
Sound
�Minijacks for 16-bit stereo audio input
and output; 44.1-kHz sampling rate
�Built-in speaker

Graphics support ATI RAGE 128 graphics card with 16MB of SDRAM graphics
memory, which provides the following capabilities: 2D performance �128-bit
internal engine �Hardware acceleration of graphics and video
�Support for
up to 1,920- by 1,200-pixel resolution at 32 bits per pixel (millions of
colors) 3D performance �Advanced integrated triangle setup engine
�Single-pass multitexturing design �Full 32-bit-per- pixel (bpp) Z buffer
and 8-bpp stencil buffer �Robust support of QuickDraw 3D RAVE and OpenGL

Keyboard and mouse Apple USB Keyboard

Peter S.
PowerBook G3/266....14'', 64MB, 4G's, ethernet, 56k, S-Video out....

What ever the Mac has, it doesn't matter.
It cannot run TOS software as fast as the Milan.
It is not a TT clone.
It is not 100% Atari compatible.
An equal spec'ed PC can be had for much less, and is easier to find less
expensive software, hardware and service for.

And on top of that, I wouldn't purchase a piece of dog shit that was promoted
by a company that allows fools like you to represent them.

Here is the future for Apple users. Inside a PC box.

As anybody who has read this newsgroup for very long knows, I am a Mac booster. I find the Mac so far ahead of Windows in the arena of ease of use, productivity, and just the sheer pleasure of use, that I find Windows laughable. Those who know me also know that I can be one of Apple's harshest critics. It is in this latter capacity that I write now. Apple has done much to clean up its act, but in one area, they are severely lacking. Customer service. There are many aspects to customer service, but the one that I am addressing has to do with the post purchase upgradability of the new Yosemite Macs. These are marvelous machines, no doubt about it; possibly the best Macs ever made. If one buys one from the Apple store, loaded to the gills, one will have one hell of a computer - as well as an expensive one. The PC buyer, on the other hand, doesn't need to go to Michael Dell, or Gateway to get a custom configured machine, but Mac buyers have to go to the Apple store for one. A PC buyer can go into any of hundreds of stores selling PCs, and tell them EXACTLY what speed, case, HD, CD/DVD, SuperDrives, floppies (one or two?), amount of RAM, what kind of video performance and price range of video card, sound card, on-board modem, brand of processor, etc that they want. The list is seemingly endless. The store will also add all of these options to one's chosen box right there at the point of sale. Even if one buys a Compaq or an HP, the dealer will install a Zip drive, extra memory, a voodoo 2 card , a soundblaster pro card, whatever the customer wants, right there, while they wait in many cases. Not so with the new G3. EVERYTHING must be ordered at the Apple store when you order your computer, or you don't get it. Decide after buying that new G3 that you want that $50 SCSI card that was a build option for custom configured machines? Try going to the Apple store AFTER MARKET and ordering one. YOU can't. Ditto the internal modem, or anything else listed as build options for the Yosemite.

Now we get to my saga of the Zip drive. When I decided that I wanted a new Yosemite machine, I ordered it from the Apple Store. I ordered an internal Zip drive, the $50 SCSI card, and the internal modem. It was almost four weeks before I stumbled upon the fact that I could buy the same box, the Apple internal modem, an Adaptek SCSI card (neither installed, but who cares) and get them for almost $400 cheaper than the same box from the

Apple Store, have it delivered overnight, and pay NO shipping or CA sales tax. Apple has had me waiting for weeks. needless to say, I called the Apple store and canceled my order. The Zip drive, I hear you wondering. Well, There is a place here in the bay area that has brand new ATAPI EIDE internal Iomega 100 MB Zip drives for $59. Since all the Yosemite boxes come with the mounting bay for a 3.5" removable device (complete with EIDE cable already wired), I figured that I would beat the game and buy the machine Zip-less from Cyberian, and then install one of these $59 specials myself (take THAT, Apple!). Only one problem. When you buy a Zip-less Yosemite box you get a blank blue plastic plate instead of the Zip bezel. No problem, I said, I'll go to my local Apple dealer and order one. Well, easier said than done. I went to two Apple resellers (with in-house repair facilities who order Apple parts all of the time) and asked if they could order one of these bezels. The first one told me that they were unavailable. The second one said that since he had no part number for the piece, that he couldn't order it. I then, in desperation, called Apple Customer Relations. They in turn, called Apple store number two that I had just visited, and read them the riot act (I guess), because when I went back there (at the Apple rep's behest), the repair department manager (the same one who told me that he could not order such a beast) grudgingly took my order (making me pay in advance) And what he made me pay! Guess what Apple is charging for this simple piece of 5.75" X 1.75" blue plastic with a slot in the middle to stick a Zip disk in? $1.00? $5.00? $10.00? EHHHHH! Thanks for playing. Try FORTY ($40) US DOLLARS! Can you say SCREW THE CUSTOMER? This is one aspect of Apple that they have never changed. Any after market Mac items from Apple are sold as "replacement parts" and cost from three to one hundred times what they should cost. Its the reason why upgrade boards for older Macs almost always cost more than the cost of a whole new machine. Apple has never addressed this, and they need to do so, badly.

Apple seems to think that if you want a loaded Mac, then you should buy it all at once. They don't understand that lots of people can just afford a basic configuration, with the idea of adding the bells and whistles that they want later. Apple makes it difficult or impossible to do this, and they always have. PC manufacturers understand this, and understand too that it is a source of continuing after market income. Why can't Apple? They can't sell these options to you after you've bought one of these machines under any circumstances. You must go through parts where a Zip drive installation kit which adds $100 to the cost of your Mac at the time of sale, becomes a $300 parts item. Hasn't it ever occurred to the people at Apple that somebody might NEED to add a Zip drive that they didn't think that they needed originally, at some point down the road? Apple get a clue.

Comments anyone? (other than the inevitable Wintroll telling me that had I bought a PC, I wouldn't have this problem. I'll save you the trouble. had I bought a new PC, I would have to use Windows. NOTHING is worth stooping to that level. I would also have to buy all new software, Illustrator, Office, Photoshop, FramemMaker, PageMaker QuarkXpress, Etc. That's considerably more than the $40 for a piece of plastic.

    I've used 8.5 myself AND MagiC, so I know what I'm talking about.
Whereas, my odious little troll, who has used an Atari ST a grand total
of ONCE, you can only pretend to claim what you claim.

    BTW, according to the Apple Rep at ComputerFest this last weekend
```

in TO, the current iMac still only comes with 32mB RAM standard. All
the reviews I've seen of 8.5 recommend that you go up to 64 megs in
order to actually get things done. KA-CHING!

Strange how I'm getting a lot done with my "old, archaic" Falcon
under MagiC - including doing some scanning work for a friend's web
page project - with a nice hi-res TrueColour display, MagiC/Thing
desktop - that only takes up a total of 4 megs total RAM, about 2 megs
hard drive space, and still have 10 megs of RAM to load lots of
programs in.

Actually, Mac OS X Server is a great value for what it is. The problem is that a lot of people don't need it to be all that it is. I, for example, would like to use Mac OS X Server as a workstation operating system so I don't need a WebObjects deployment license, AppleShare IP or netboot capabilities. Many people probably don't even want the development tools. But if you want to use Mac OS X Server at all, you have to pay for everything. It would be nice if Apple would offer a workstation addition for $200 and a development addition for $500.

Nice! I hope Alexander has managed to make it function as smoothly on
the imac as it does on the Atari... :)

Friends and fellow Atari Enthusiasts:

It is my distinct pleasure to announce a new streaming Internet radio webcast dedicated to all things Atari. Back In Time � The Radio Webcast has made its debut at http://www.emuclassics.com/backintime.

New episodes will be taped monthly. The show will feature news, reviews, and interviews. (Say that five times fast!) My guest for the first episode is the man STart magazine dubbed �The Ultimate Atarian,� Donald A. Thomas Jr. Don will be discussing his days at Atari, the Tramiel family, the current state of classic gaming and computing, and Nuon.

The second episode will be posted in early March. Future episodes will feature many people from Atari�s past, including former Atari employees, hardware/software developers, etc. I will also feature the developers of current Jaguar/Lynx titles, and emulator authors that allow us to recreate the classic gaming and computing experience on the PC�s used today. Each episode will run for about 30 minutes.

To listen to the show, you will need a PC or Mac, and a copy of the Real Audio player. The Real Audio player is a free download from Real Networks. A link to download the player can be found on the Back In Time web site.

Mike Stulir

Mr Sinclair,

As a long time fan of Atari I must take exception to your continuous line of banter on the merits of the iMac. I feel that a true comparison of machines would be to compare an atari based product with a apple product of equal abilities, You will find no such comparison Your constant drivel and gushing over the iMac reminds one of a neighbor of mine who gushes incesantly about his honda accord. Fine if you like jap cars.... I DON'T. As far as the apps you gush over. In two words WHO CARES. As far as the ATI rage 128 bit card you flap about. You will be saddened to know that the ATI card is an also-ran in the PC world.

Lastly I thought that you might like to know that currently pending before the Md State legislature is a new bill which provides for the ability to file complaints and suits over any form of internet harrassment to include newsgroups AND since you do work for a company with offices in MD. (CompUSA) YOU would be subject litigation filed against CompUSA as a CompUSA representative.

And yes I have copies of your posts for the last year in which the Comp USA name is prominently mentioned.

I am sure that CompUSA could find out who has been associating its good name with your inflamitory remarks.

Oh, quit the legal shit already.
USENET should remain a forum where anyone can have a say, about any subject, without having to worry about getting sued for expressing a view.

Only in America...

Regards,

Clockmeister.

I believe that Microsoft is not releasing the latest version of Encarta for the Mac OS and they are considering dropping all future Mac OS development of Encarta.

Actually, the ATI Fury (which uses the Rage 128 chipset) was just released
for the PC and I haven't seen any benchmarks to suggest that it won't be a
top tier performer. I will be interesting to see how it performs against the
TNT.

Besides office 98, Explorer and Outlook express what other products do MS
develop for the Mac platform? Office 98 is a cash cow for MS.

FYI. Apple bundles World Book on the fruit flavor imacs..

Views are fine and I have no problem with anyone voicing his or her opinion on USENET or any other forum for that matter. I believe in the Constitution, But views should never include statements regarding a company when it is that companies express policy to remain neutral in these matters. And these views must never make the appearance or pretence of having the backing of a specific company when they in fact do not.

Actually I should have checked my facts. The iMac ships with the ATI Rage Pro
Turbo which is based on the ATI Rage 2c chip a 64bit chip. This was the
processor I was referencing. The actual board mentioned by Mr. Sinclair is the
ATI Nexus 128 , a Rage 128 based board. It is indeed fast and a wonderful board,
But for the iMac it is unfortunately stunted by the iMac 33Mhz PCI bus. Sorry No
66Mhz AGP 2x implimentation available for the iMac nor 4x AGP v2 slot. And sorry
the ATI board is not Cheap in iMac skin.

Gosh Peter did I strike a nerve. Your (what should have been one [1] word [whatever]) reply is the shortest reply I have ever seen you write. Quite out of character, For one so verbose and opinionated.

Harold
its not the hardware but how you use it that counts!

What planet are you from? You must so totally have missed this "let's be friends, have fun and exchange knowledge" part of usenet news. Take some time to discover the thrill of beleiving that you yourself might not share others opinions and there's no harrasment involved whatsoever. No one's to say you can't discuss them in an open forum.

And even if that intresting part about you keeping copies of postings and mentioning it in that manner you do might do wonders to your self esteem it does not have anything at all to do in this newsgroup. Neither seem you.

And if you beleive in that legal part I'll insult you any time and you can try to get me to court.

George Graves wrote:

<snipped only because of space, even though it should be read again>

Let me speak from the other side of the counter. Just to make things interesting, I work at my local CompUSA. With the standard disclaimer that my opinions are mine and no one else's, let me share my views on your experiences.

First off, you are 100% correct. Apple needs to solve some SERIOUS customer service issues if they ever want to get ahead. But if you think that it's bad on the customer, I'll give you some insight as to how it is for the dealer.

Let's start with the pre-sale and the sale of the machine. For historical significance, we're talking one week ago (Friday). You walk up to me, we spend about 1/2 hour talking about various configurations of Yosemite, and then you decide you wish to purchase. I remind you for the 3d or 4th time that there is no modem in the machine - and although we expect that Apple is going to release an aftermarket modem, DVD and Zip kit for the G3, we have nothing currently in stock or on order. You say ok, take the 400 and walk out of the store.

Next day comes in customer #2 (now Saturday). This person asks pretty much the same questions and I admonish the same warnings. They are so pissed at ME that they walk out of the store. In their minds, it was MY fault that Apple doesn't offer the parts yet. I'm frustrated, so I go and call Apple. I find out that Apple is "working" on a modem kit, but that there is no release date. So I get curious and check the part # and pricing for a replacement iMac modem (as I was told that they are basically the same thing). Apple tells me they are $300 as replacement parts (3x the cost of the Apple modem kit) and that they don't come with any drivers or instruction manuals. Customer #3 comes in and gets the 400 based on the information that I provide that Apple SAYS they are going to release the modem soon.

By Monday, Apple announces the part number. (Would it have been too big a deal for the Apple person to tell me that they were coming out in 2 days - or am I really to believe that Reseller Support doesn't know product availability that close to release?) Every customer who comes in this week and talks to me about the machine is told that the modems are coming, and I even provide them the Apple part # (M7405LL/A, if you're interested). I also advise that they order one via Apple, as it may get to them sooner than if they wait for the to get to the stores.

Customer #2 comes back. I know (as he does) that he wants the machine, and I can now tell him that the modems are coming. No apology - still pissed that we don't have them in stock.

OK... so now the machine is sold. The customer wants memory. I'm not sure about any of you, but iMac RAM, IMHO, is goofy. Manufacturers who make it don't even follow a specific standard when it comes to total dimensions, and this is a problem when there isn't the same wiggle room on the bottom iMac slot that there is on the top. So I've had to turn away several customers because we don't have the right SIZE of the right RAM. As for Yosemite, PC100 was supposed to be common. But, and I know this doesn't have to do too much with Apple, there aren't any PC100 128 or 256MB chips in our store. I had a customer as for a 1/2GB of RAM upgrade and I couldn't give it to him.

So anyway, we also don't have any of the bezels for Zip drives and we sure as heck don't have any DVD drives or modems yet. So we turn people away - and the customer isn't mad at Apple - they're mad at CompUSA.

What can we do about this?

BTW, we only yesterday received any of the USB mice, keyboards and joysticks that have been on the market for a few months now. Additionally, we've never carried the iPrint, uSCSI or any of the other adapters necessary to connect

an iMac with old devices (except for the HP and Epson printer adapters).
Again, CompUSA looks foolish - and we continue to tick off Mac users
(especially THIS mac user).

OK... sorry to vent. Hope I gave SOME useful information.

-Jeff

I don't understand. First you state that the Rage 128 chipset is not used in the iMac (which is true) and then that "...it is stunted by the iMac['s] 33MHz PCI bus." BTW, I don't think that it is reasonable to expect that iMac to use the Rage 128. The cost, to consumers, of the Fury is $200 so lets assume that Apple can get it for $150. That is about 15% of the cost of the iMac. What Apple should do is make a gMac with a better graphics system and faster processor. They could charge $300 more for it.

Brian,

I never meant to lead you to believe the ATI Nexus 128 was a standard item for
the iMac. It is an available for purchase through third party vendors like me for
the iMac. (It happens to be ATI's best Mac offering) . You idea for a gMac is great
but if you were to build a graphics based machine (from a professional standpoint)
You might want a graphics engine based around HEIDI and openGL not just openGL. For
this you would be talking some very serious change , on the order of $500.00 to $1500.00
just for the graphics card.

Harold

PS when are we going to start talking Atari in the newsgroup again.

Can people stop talking Mac in here and get back to Atari? If you want to talk Mac, then by all means go to a Mac newsgroup or private mail.

I know that you people in North America get free local phone calls, but in other parts of the world we have to pay for them, and unwanted (long) posts about other machines in an ATARI newsgroup are just not wanted.

Thankyou.

Cheers!

James

I agree. Now the altered topic should be of interest to most Falcon (AWA TT owners) and future possible Milan owners. I suggest that anyone really interested in the new clones search around the web for other applications of the 68040 and 68060 to see what is available. I found several interesting sites, one where a guy built his own MC 68060 motherboard. Another is a site where a 68060 PCI card is in the works to run Mac O/S on a PC. Dual 68060's on VME cards. The Mars Rover used 060's.

Seems like an interesting topic. If vendors can produce fine hardware for other makes of computers, then it shouldn't be so hard for these visiting experts to explain how we can adapt them to our systems. After all, we die hards will never purchase a new G3, so they can just give up and help out, or get out.

Hot Soldering Iron

Wake up Harold. This is comp.sys.atari.ADVOCACY
Without TIKAS and his sidekick, bugger all would be happening here.
I enjoy being offended by TIFKAS.

However two things are clear in the recent weeks.

1ST is DAN accepted defeat in G3 vs Milan.
2ND is TIKAS avoids all customer service questions posted by Dan, just as he probably avoids his own customers problems:-).
However none of this banter affects me and my humble 520ST from being the cheapest internet machine going.
3rd With iCAB coming out for Macs for a PRICE, perhaps older Macs can do some thing useful on the internet, like older Ataris, otherwise why did ASH even bother no one would buy a browser when better ones are FREE. Unless of course you read the papers saying that buying a CD of the latest Netscape is worth the price vs downloading it. Sure it is:-).

Finally Harold, I don't believe your post was even sent via an Atari.
A true Jihad would be beaten to death for this indescrection.

Later Brian.

Brian
I happen to be typing on an Atari PC5. I have personally utilised Atari computers since my first 400 in 1980 Since then I have owned and used the 800, 800xl, 1200xl, 130xegm, 520 ST, mega 4. mega STe 4, TT/system V, ABC 386, Atari PC5. not to mention my 2600,7800, Jaguar/CD, Lynxes, and Touch Me. The best part is I still own all of these machines and use them. The fact is I couldn't be more Atari oriented, all the way down to the Fuji on my Jeep.
Lastly the G3 vs. Milan comparison isn't fair because you are not comparing equivalent machines. Lastly the price issue is moot. Sure Apple can sell the iMac for less they manufacture many, many more.

For Immediate Release

Former Atari Editors to Debut New Online Magazine

[February 19, 1999, Boston] Former STReport Atari Editors Dana Jacobson and Joe Mirando announced today that they have begun work on a new Atari online magazine. A-ONE (Atari Online News, Etc.), which will likely debut on Friday, March 5, will be a magazine primarily aimed to serve the Atari community, according to Jacobson. "Our goal," said Jacobson, "is to focus on a magazine which covers material of interest to fellow Atari users. We'll do our best to cover all facets of the Atari experience - computing and console gaming. But, we'll also cover topics that are of a general interest to Atari users: general industry news items and other gaming platforms."

"Joe and I have been using and writing about Atari computers for a long time," says Jacobson. "Between the two of us," he added, "we've probably written for most of the commercial Atari magazines of yesteryear such as Current Notes, Atari Interface, ST Informer, and Atari Explorer. And we just completed a lengthy stint with STReport, an online magazine. We have both considered doing an Atari online magazine on our own for quite some time now. The talks became more serious the past few weeks and many of our STReport readers were asking. The timing was perfect."

Jacobson states that A-ONE readers will see the same coverage as they did with STReport, but more. "Columns such as 'People Are Talking' will continue in A-One," states Jacobson, "and the Atari news items, various announcements and product descriptions will continue. We're also going to continue with the computing and technology industry news section, as well as Atari and other platform gaming news. All of that will remain unchanged, except cosmetically."

When asked what new things A-ONE readers will be able to see in the magazine, Jacobson reported that "we have a lot of new ideas; and we're going to be able to resurrect some old ones! We've talked to Michael Burkley, of Suzy B's fame. A-ONE readers will be happy to learn that Michael has agreed to bring back his "Unabashed Atariophile" column - a column devoted to Atari public domain, shareware, and freeware software. We're also looking to get more involved with Atari internet news. We're working on 'guest columns.' We'll be talking to a number of people to help us make A-ONE the #1 Atari online magazine worldwide."

According to Jacobson, A-ONE will be a text-based magazine. However, he stated that an HTML version hasn't been ruled out as an additional format. "We're in the process of establishing distribution points for the magazine," Jacobson stated. "We'll maintain our e-mail distribution lists as well as making the magazine available on online services such as Delphi and bulletin boards. We'll also make it available for downloading via numerous Internet web pages. The best way to do this, and make it accessible to all readers, is text. But we realize that some of our readers may want to read A-ONE while on the Internet. The 'plain' text version will be available initially, but we're also considering adding an HTML version, with all the 'eye-candy,' for those who might want it."

To contact A-ONE regarding e-mail subscriptions or other inquiries, send e-mail to dpj@delphi.com . For submissions and related information, send e-mail to jmirando@portone.com .

Agreed! Its like comparing 'Apples' and Chili peppers...Apples are bland pieces
of fruit...chili peppers are hot items that spice up any dreary food...

> I feel that a true comparison
> of machines would be to compare an atari based product with a apple

Whats wrong with a Honda Accord? It might be a bit family oriented
and lack a little outright performance (which is why I bought a
Prelude!) ;^), but its still a fine car?!   :)

Mind you a Honda NSX would be better...anyone got a spare one they
would like to lend me? :)

> As far as the apps you gush over. In two words WHO
> CARES.

Check out Mac users positive response to the port of CAB to Macintosh
in the comp.infosystems.www.browsers.mac newsgroup. Seems that a
piece of Atari software is making Mac owners drool all of a sudden...

Do you own a pipe Mr.Sinclair-Day? Seems you'll need to put that in it
and SMOKE IT!...

BTW Peter, visit http://www.icab.de, grab the demo, and experience what

YOU have been missing all this time!...

Sayonara sucker...

Chris Wilkinson,
/|\ ATARI Falcon030 owner.

So why do you need to use a PC if your Amiga OS is so great?

8.5 has sold 2 million units and has lived up to the hype..

Oh what denial! Hasbro owns the scraps of Atari has no interest in entering
the computer market. I have notice that Hasbro has indeed reentered the
market with Atari's old game library...

Image FX, Imagine, Lightwave (which can use the Photoshop plugins),

Numerous DTP packages, Navigator is being ported whilst Aweb (with Java
support), IBrowse and Voyager are all good browsers. YAM, NewYork, and
probably the best newsreader on any platform, Thor.
Not to mention Miami, the easiest of all TCP stacks and Amiga has the best
IRC clients available on any platform.

Likewise, the list goes on. Being ignorant of the availability of software
for another platform doesn't give justification for you to judge the
software availability for that platform.

A PC is not an OS. Best of both worlds?.
Is there a reason why I shouldn't use two platforms?.

> 8.5 has sold 2 million units and has lived up to the hype..

Blind faith. 8.5 is just a makeover, the core is still rotten.

Get's the job done, providing it doesn't crash and you don't mind the fact
that co-operative multitasking stinks and MacOS is still rotten at core
level. Productivity is obviously not an issue when you buy an Apple PC.

Regards,

Clockmeister.

Toshiba/Microsoft Saga

Geoffrey D. Bennett
geoffrey@netcraft.com.au
12/Aug/1998

I hope that this web page will prove useful to those people who want to purchase a laptop without Microsoft Windows. The short summary is:

It is near impossible to buy a laptop without Windows
The Microsoft Software License Agreement allows you to return the software if you do not agree to its terms.
It is difficult, but not impossible to get Toshiba (at least in Australia) to send you a cheque in return for the Windows License.

I purchased a Toshiba notebook on February 2nd this year from my local Linux-friendly supplier (Nick Stock at Cybernet Systems). Being the devoted Linux user I am, I didn't want to pay for a copy of Microsoft Windows if I wasn't going to use it. Unfortunately, Nick informed me that it was impossible to purchase a Toshiba (or practically any brand of notebook) without Windows coming along for the ride.

When I received the computer, I noted that the ``End User License Agreement for Microsoft Software'' stated that I did not have to accept the agreeement, and if I didn't agree to its terms, I could contact the manufacturer for instructions on returning the software for a refund. That seemed like just what I wanted, so I contacted Toshiba in Adelaide and spoke with Kon Karanastasis.

Kon had apparently never heard of anyone wanting to return just the software for a refund, so it took a while to explain what I wanted. "I want to give you back the Microsoft software and receive a cheque in return", "We don't do that", "But the license agreement that Toshiba supplied with my computer says you will". Kon asked that I send him a letter explaining what I wanted, along with a copy of the invoice for the notebook and he'd find out what could be done.

Here's the letter:

NetCraft Australia
PO Box 390 Blackwood 5051
Phone: 08 8370 3650
Fax: 08 8278 8325

2 February 1998

Mr. Kon Karanastasis
Toshiba
5 Hurtle Square
Adelaide SA 5000

Dear Kon,

With reference to my phone call to you today, I have purchased a Toshiba Satellite Pro laptop computer which included a copy of Microsoft Windows 95 pre-installed. The ``End-User License Agreement For Microsoft Software'' included with the computer states in part:

If you do not agree to the terms of this EULA, PC Manufacturer and Microsoft are unwilling to license the SOFTWARE PRODUCT to you. In such event, you may not use or copy the SOFTWARE PRODUCT, and you should promptly contact PC Manufacturer for instructions on return of the unused products(s) for a refund.

I do not agree to the terms of the End-User License Agreement for the Windows 95 software, and would like to return the software for a refund. Please supply me with instructions on how to return the software.

As you requested, I have enclosed a copy of the invoice for the Toshiba laptop computer.

> Regards,
>
> (signed)
>
> Geoffrey D. Bennett
> Computer Systems Manager
> NetCraft Australia

Kon got back to me and the word from Sydney was that Toshiba would be happy for me to return my notebook and receive a full refund, but they were not willing to give me a refund on just the Microsoft Software. I explained that this was unacceptable; the license agreement for the Software specifically said that I could return just the Software. Too bad apparently; Toshiba have a contractual agreement with Microsoft where they can't unbundle the software from the hardware, therefore they wouldn't give me a refund.

I obviously wasn't happy with this, so Kon said that the person to talk to was Laurence White from Product Planning in Toshiba. I sent him an email explaining the situation:

> Date: Tue, 3 Mar 1998 16:25:06 +1030 (CST)

Laurence told me essentially the same thing that Kon did. I can return the notebook, but I can't return just the Software:

Date: Thu, 05 Mar 98 10:08:40
From: "laurence white" <laurence_white@isd.toshiba.com.au>
To: "Geoffrey D. Bennett" <g@netcraft.com.au>
Subject: Re: Return of unused software

Hello Geoffrey,

I am the Toshiba Product Manager and am responsible for all notebooks.

The EULA you have received is a generic Microsoft document supplied by all manufacturers as proof of the purchase of your operating system.

As you can see in the wording of the text you need to contact a vendor for
instructions and Toshiba is unwilling to refund the cost of the operating
system.

Toshiba is required by Microsoft contract to provide and purchase a valid operating system. Toshiba cannot get a refund from Microsoft.

I hope you can understand our position. Toshiba must pay Microsoft at point
of manufacture and cannot get a refund from Microsoft, so we can't refund
you.

If we gave you a refund on the operating system component then Toshiba
cannot claim this on Microsoft.

I hope this explains our position with Microsoft Software.

Regards
Laurie White
Toshiba Australia

(my original message was included here)

If at first you don't succeed... so I asked again, explaining why his reasons for refusing a refund were not valid:

Date: Thu, 19 Mar 1998 02:26:22 +1030 (CST)

To: laurence_white@isd.toshiba.com.au (laurence white)
Subject: Re: Return of unused software

Hi Laurie,

Thank you for your reply to my message regarding the return of unused Microsoft software. Although I understand Toshiba's position, it is not acceptable for reasons I give below, and therefore, I would like to request for the second time you to send me instructions on how to return the unused Microsoft software to Toshiba and obtain a refund for that software.

You wrote:

> Hello Geoffrey, > > I am the Toshiba Product Manager and am responsible for all notebooks. > > The EULA you have received is a generic Microsoft document supplied by all > manufacturers as proof of the purchase of your operating system.

I'm not sure how this is relevant? The EULA certainly is my proof of purchase, but it is a lot more than that. The EULA states the terms under which the software is to be licensed to me under. I have rejected those terms, and according to the agreement I may not use or copy the software and I should return it for a refund.

The EULA is the document that specifically says that PC Manufacturer (Toshiba in this case) and Microsoft are unwilling to license the software to me, and I should contact Toshiba for instructions on returning the software for a refund.

> As you can see in the wording of the text you need to contact a vendor for > instructions and Toshiba is unwilling to refund the cost of the operating > system.

Toshiba might be unwilling this month to refund the cost of the operating system to me, but the EULA which was sent to me last month by Toshiba with the computer when I purchased it does not include a provision for you to reject my claim for a refund.

If Toshiba were not willing to refund the cost of unwanted software to me when I purchased the product, Toshiba should not have supplied me with a license agreement that states that I can return the software for a refund.

> Toshiba is required by Microsoft contract to provide and purchase a
valid
> operating system. Toshiba cannot get a refund from Microsoft.

The agreement between Toshiba and Microsoft is irrelevant to me.

The agreement between myself, Toshiba, and Microsoft says that I can return the product for a refund. Whether or not Toshiba can then receive a refund from Microsoft is really none of my business.

> I hope you can understand our position. Toshiba must pay Microsoft at point > of manufacture and cannot get a refund from Microsoft, so we can't refund > you. > > If we gave you a refund on the operating system component then Toshiba > cannot claim this on Microsoft. > > I hope this explains our position with Microsoft Software.

I do understand your position, but if Toshiba enter into an agreement with Microsoft where Toshiba is required to purchase Microsoft software for each notebook, then Toshiba should be willing to wear the cost of that software if I do not want to purchase that software from you.

Surely the discounts obtained by purchasing Microsoft software with every notebook manufactured far outweigh the cost associated with me not wanting to purchase the Microsoft software from Toshiba? If they don't, perhaps Toshiba should review their agreement with Microsoft.

I look forward to your reply.

Regards,
Geoffrey.

To: "Geoffrey D. Bennett" <g@netcraft.com.au>
Subject: Re[2]: Return of unused software

Geoffrey,

Toshiba is happy for you to return the complete computer system for a refund to the place of purchase. We are not willing to sell just the computer system to you.

If you have any further questions regarding this matter you will need to talk with our legal department.

Regards
Laurie White

(my first reply was included here)

I called the ACCC (Australian Competition and Consumer Commission) who said that selling one product bundled with another as Toshiba are doing is an okay thing to do, and then I called Consumer Affairs who suggested I see a lawyer. I ended up going to see someone from the Legal Services Commission who said that I could take my case to the small claims court and I'd probably win, but if I didn't then I'd be up for their expenses (plane trip from Sydney plus hotel accomodation). I definately didn't want to take that risk, so I decided to give in.

By this time, the model of notebook I had purchased was discontinued (it had been about two months since I purchased it) and the next model up was $700 cheaper than what I had paid for mine. Since Toshiba were offering me the chance to return the entire computer, this was obviously a good deal. They were effectively offering me $700 and a notebook upgrade :-). I didn't really want to pursue this option, since I would still be paying for a copy of Microsoft Windows that I didn't want (it's the principle of the thing!), but I didn't see any other option.

So I contacted Nick, who was quite happy to take the computer back from me provided that his supplier would take it back from him. Unfortunately, his supplier didn't like this idea and were quite ticked off that Toshiba would say to me that I could return a pre-loved, two-month old, and discontinued computer at their expense. They wanted to know who at Toshiba told me this.

I then get an email (quite unexpectedly) from Kon Karanastasis, who wrote:

> Date: Thu, 02 Apr 98 13:46:11
> From: "kon karanastasis" <kon_karanastasis@isd.toshiba.com.au>

Fax : 08 8232 5022

I thought that the above message was a bit strange, since I hadn't talked to Kon for quite a while now, and I wasn't asking them consider a refund for the unused software anymore. I wrote the following email back:

Date: Thu, 2 Apr 1998 15:42:33 +0930 (CST)
From: "Geoffrey D. Bennett" <g@netcraft.com.au>
To: kon_karanastasis@isd.toshiba.com.au (kon karanastasis)
Subject: Re: Return of Unused Software

Dear Kon,

You wrote:

> Dear Geoffrey
>
> In respect to your formal request for a refund for unused software on your
> Toshiba Laptop Computer the matter is currently being assessed by our
> General Affairs Division.

I'm a bit confused here, because my refund for unused software has been assessed and denied three times already, each time with an offer for me to return the entire computer, and the last time also telling me that I'd need to contact Toshiba's Legal Department if I wanted to take the issue of returning just the software any further. After the three refusals, I decided to take up the multiple offers of returning the computer, so I contacted my supplier to arrange doing so.

Are Toshiba now reconsidering the refund for the unused software? If so, that is fine, but if it is refused (for the fourth time), I will be again wanting to take you up on your offer for me to return the entire computer.

> Before they reach a final decision they have asked me the following questions
> in respect to your purchase ;
>
> 1. Mr Bennett states that he purchased the computer on 2nd February 1998.
>
> From whom did Mr Bennett purchase the computer?

I purchased the computer from Nicholas Stock at Cybernet Systems (017 864 264). I sent you a copy of the invoice on February 2nd.

> 2. Did he rely on a brochure in making his decision?

No, I didn't rely on a brochure in making my decision. I read many brochures, viewed many web pages, and talked to many people when deciding which notebook to purchase.

> 3. At the time of purchase did he notify the vendor that he did not want the standard MS operating system?

My vendor was aware before I purchased the computer that I did not want the standard MS operating system. My vendor had already informed me that it was not possible to have Windows removed from the computer before purchasing it.

> 4. Did Mr Bennett read the End User License Agreement prior to turning on the Computer for the first time?

I did. The license agrement said that if I did not agree to its terms, Toshiba and Microsoft were unwilling to license the software to me, and I could return the software for a refund. Therefore, I did not use the software, and I contacted Kon to arrange a refund.

> 5. Mr Bennett states that he "refrained from using the software, and .... completely removed it without creating any backup". How was this accomplished? When was the Operating System deleted?

I removed the operating system by connecting the floppy disk drive, inserting a Red Hat Linux boot floppy, turning on the computer, deleting all partitions on the hard disk, and installing Linux. I did this on the same day I received the computer.

> 6. Has the computer been used between the dates of 2nd February > 1998 and 3rd March 1998? If in the affirmative, utilising > what operating system?

Yes, the computer has been used the entire time I have had it. The operating system used has been the Red Hat Linux operating system.

Geoffrey D. Bennett (geoffrey@netcraft.com.au)
Computer Systems Manager, NetCraft Australia
http://www.netcraft.com.au/geoffrey/
Red Hat Linux Resellers: http://www.netcraft.com.au/redhat/

The next day I received an email back from Kon:

Date: Fri, 03 Apr 98 13:14:32
From: "kon karanastasis" <kon_karanastasis@isd.toshiba.com.au>
To: "Geoffrey D. Bennett" <g@netcraft.com.au>
Subject: RE: Return of Unused Software

Geoffrey

Toshiba's General Affairs Division have assessed your claim for a refund of the unused Microsoft Software.

Toshiba is prepared to offer you $110.00 (AUS) as a refund for not using the bundled software.

Please confirm your acceptance (or otherwise) of this offer and we will implement the
appropriate actions to settle this matter.

Regards

Kon Karanastasis

(the message he replied to was included here)

Since this was exactly what I was wanting, I wrote back:

Hi Kon,

That sounds good. Let me know what the next step is.

Regards,

--
Geoffrey D. Bennett (geoffrey@netcraft.com.au)
Computer Systems Manager, NetCraft Australia
http://www.netcraft.com.au/geoffrey/
Red Hat Linux Resellers: http://www.netcraft.com.au/redhat/

Time passed, and I called Kon to find out what was happening to my cheque. He explained that in big companies, weird things like giving money to customers for return of Microsoft software can take a while to happen. A little later I received an email from him:

Date: Thu, 07 May 98 14:51:43 +1000
From: "KON KARANASTASIS"<kon_karanastasis@tap.toshiba.com.au>
To: <geoffrey@netcraft.com.au>
Subject: Refund for Unused Software

Geoffrey

I've followed up the progress of your refund cheque.

I still can't give you a definite date, however, I think I've managed to put some higher priority on your claim.

Hopefully it should all be resolved within a fortnight.

Regards

Kon Karanastasis

Email : Kon_Karanastasis@tap.toshiba.com.au

And then the email I was waiting for:

Date: Thu, 21 May 98 10:46:44 +1000
From: "KON KARANASTASIS"<kon_karanastasis@tap.toshiba.com.au>
To: <geoffrey@netcraft.com.au>
Subject: Refund Cheque

Hi Geoffrey

Your refund cheque has arrived in Adelaide.

If you would like to return all documentation/software relating to MS Windows to
Our office at 5 Hurtle Square you can pick up your cheque.

Regards

Kon Karanastasis

I couldn't pick up the cheque immediately because I had just left for Linux Expo, but when I got back I wasn't in any particular hurry to get the cheque because it was the principle of the thing, not the money. After some hassling from a couple of LinuxSA members at the July meeting, I finally went to Toshiba on the 10th of August to pick up my cheque.

Lo and behold, I now have a cheque for $110 from Toshiba in return for an unused license for Microsoft Windows!

Many thanks to:

Paul Ashton (of Samba fame). Paul was the one who told me in January that when I purchase a laptop I should read the Microsoft Licence Agreement, and take note of the bit about a refund. Kon Karanastasis at Toshiba for being patient with such a strange request. Nick Stock at Cybernet Systems for being an all-round good guy.

No thanks to:

Laurence White at Toshiba for three times denying my request for Toshiba to honour the license agreement they included with my computer.

If there's anyone else wanting to do a similar thing, I think that the important things are:

Check the license agreement. Look for something like ``If you do not agree to the terms of this EULA, PC Manufacturer and Microsoft are unwilling to license the SOFTWARE PRODUCT to you. In such event, you may not use or copy the SOFTWARE PRODUCT, and you should promptly contact PC Manufacturer for instructions on return of the unused products(s) for a refund.''

As the first thing you do with the computer after you purchase it, boot from a floppy and delete the Windows partition. If you boot Windows even once, you will probably be considered to have accepted the agreement. To prevent any arguments later, it would be best to delete the partition while you are still in the store, with the salesperson watching.

Contact your manufacturer immediately, and say that you do not agree to the terms of the EULA and would like instructions on return of the unused Microsoft Software for a refund.

Well, it all just cackles out the monitor. Back then only the Amiga had sound and the 1000 only had 256k to do it with. Yuck. What is amazing is what the Union got for sound out of a normal ST with the UNION DEMO. One of my old favorites.

You have the bottom line Atari so only so much is to be expected. I am using mine ATM Circa 1985 TOS 1.0 on the internet to write this to you. In the end I can't say I have been to dissapointed with mine after 14 years:-).

Yes it does..I know what apps are available on the Amiga. 90% are
third/fourth rate apps... Thats why I went to the Mac platform to get the
job done!

>
> A PC is not an OS. Best of both worlds?.

You have not used 8.5 have you? And you have a short selective memory..The
Amiga crashed constantly...It was those dammmmm guru errors.. I thought it
was helarious at the time is when the local cable company used the Amiga for
the public info bulletin board...Would always crash on the weekends with that
dammm stupid guru error that needed to be reset but only on the following
Mondays when the office opened..

A cheap adaptor sorted that problem. The signals have allways been there on
the serial port.

Not in this country... 256k Amigas where never released with the early
A1000's all having the 256K RAM expansion included as standard. The US
Amigas with 256K did manage PMT though and that's one hell of an
avhievement considering what it took for the PC to get the same thing.

 What is amazing is what the
> Union got for sound out of a normal ST with the UNION DEMO. One of my old

It's amazing what the Spectrum crowd got out of their machines, so it's no
surprise.

Timing on PC's is horrible, which is an important part of MIDI sequencing I
believe.

One hit wonder... NOT!. They are huge in this country and are actually very
good live. (I'm not a fan though)

You obviously don't do much with your Mac if you never have a use for a PC.

Co-operative multitasking is something a C64 does, not a modern computer.

Nice try indeed...

> positive they would like to see that documentation !

If you read carefully, Microsoft actually plays no part in this. It's just Toshiba's willingness (or lack of) to refund money based on the MS license agreement.

Toshiba is bound to a licensing agreement with MS, that's for certain however...

If that copy of Windows is returned to Toshiba (it had to be sealed and complete with documentation) it would surely have been bundled with another computer, and not returned to MS.

Don't get me wrong here, I dislike MS's business practices intensely but this example is not a good one as MS plays no real part in it.

Just my 2c

Regards,

Clockmeister.

```

That's bollocks, and you are hardly the person to make such statements,
especially not when you take your comment above in account.
MacOS is a fourth-rate OS.

>> A PC is not an OS. Best of both worlds?.
>> Is there a reason why I shouldn't use two platforms?.

\>Which means the Amiga can't get the job done!

I think that's what he's implying. For example, why would he use Microsoft
Internet News when he has got an Amiga, which in fact has got the world's best
news reader, Thor (Which I'm currently using).

>> > 8.5 has sold 2 million units and has lived up to the hype..

Rock Solid Midi Timing!

*Atari 1040 STe with 4 megs of RAM (lots for this machine)
*SM125 - Monochrome Monitor
*SC-1224 - Color Monitor
*SMPTE Track Gold with external SMPTE Box
*External Maxtor scsi 245 meg HDin FaST metal case
(this cost me $700 new - oh how times change)
the HD is full of stuff too... find what ya like delete what ya don't
need. I've not used this computer for a while but I just loaded it up
and it werking PERFECT.

you can have a bunch of games too I won't need em... (lemmings 2,
bloodwynch, dungeon master etc)
I'll even toss in a Star NX 1240 24 pin Printer with extra ribbon.

All the hardware is in VERY Excellent condition....

$400 get the lot
you pay shipping

may consider a trade for some external signal processing... I could
really use a good compressor

Th best WP still supported is Papyrus. It should be available at systems
solutions or Titan in the UK.

Expose is the card that does the video capture. As for editing software,
perhaps ApexMedia could do the job.

Agreed. If you only need a word processor and not a spreadsheet or
database, then Papyrus is the choice. Hisoft also used to sell it.

Hi Brian,

Expose is a hardware video capture device. Not available anymore, and very few NTSC units were produced. It works hand in hand with Apex Media. There is another video editing application in the works called Mountain. Very nice for building animations and video clips. Looks a lot like Adobe Premeier's interface, but much faster;). (Sorry Sinplop, I couldn't resist:).

Mike

thanx

I did look at Papyrus that on my falcon , but the wp needs to run STFM 1MEG.

I am thinking maybe I should be getting my falcon to work?

True. I didn't think of that (having 4 megs myself). I remember that
Atari Works also needs at least 1 meg. Works also has a bug that
requires 4 megs to be able to print with an inkjet (HP 500), otherwise
it only prints a black page...

Anyway, both programs are a nuisance if you don't have a hard disk! Can
be run from floppy, but require constant disk swap.

> I am thinking maybe I should be getting my falcon to work?

Yes. Or get an STE (Mega preferably, with hard disk). Memory expansion
is easier.

Markku

MiNT once stood for "MiNT is Not TOS," and then, when Eric Smith went to
work for Atari, "MiNT is Now TOS."

I haven't run MiNT since about 1994; I've got an Atari ST boxed that it
should still be runnable on.

Essentially, MiNT was a "POSIX+TOS" for the Atari ST. Real, preemptive
multitasking, albeit without memory protection.

way back, oh about two-three weeks ago, TiFKAS (The iDiot Forever Known As Sinclap) was triumphantly crowing about a new program from Connectix that would increase the number of games available for the now-less-but-still-overpriced, now-less-but-still-underpowered iMac. Indeed, championed by Steve Jobs at MacWorld, the new program was designed to add more games by emulating a Sony Playstation, thereby allowing access to, theoretically, 500 Playstation titles on CD-ROM.

However, there were immediately rumblings that Sony, and their team of notably humourless patent attorneys, were not happy about Connectix' apparent violation of their game system, and were rumoured to be preparing a lawsuit. And when I reported that here, TiFKAS immediately responded with his usual denials and a prediction (note that he also aimed it at his imaginary friend "Chunks", who has never existed) :

"You are on a roll Chunks...Sony did not file a lawsuit....Look for a license deal soon..."

well, Think Again, TiFKAS - here's the news from January 28th - Sony HAS filed a lawsuit against Connectix, and has denied any licensing deal from either them or Apple.

First here's the link - to show you that the story IS going on:

http://www.sfgate.com/cgi-bin/article.cgi?file=/chronicle/archive/1999/01/28/BU14618.DTL

and now here's the meat of the story - pay close attention, TiFKAS:

<start quote>

Sony Sues Over Game Software

Jon Swartz, Chronicle Staff Writer Thursday, January 28, 1999

Sony Computer Entertainment Inc. yesterday filed suit claiming that a new software program that runs Sony PlayStation games on late-model Apple Macintosh computers infringes on its copyrights and intellectual property.

The lawsuit, filed in federal court in San Francisco against San Mateo- based Connectix Corp., seeks a temporary injunction against sales of Connectix's Virtual Game Station. The $39 program was introduced with much hoopla at Apple's Macworld Expo trade show in San Francisco earlier this month.

``We don't believe any software publisher or developer would be happy about the (Connectix product),'' a Sony spokeswoman said. ``It does not accurately emulate the PlayStation gaming experience ... and is not fully compatible with all PlayStation game titles.''

In its complaint, Sony claims that Connectix's product ``circumvents'' the PlayStation's anti-piracy policy that is designed to ``inhibit the illegal sale and distribution of counterfeit software.''

The Foster City-based Sony division added that it has not announced any partnership agreements with Connectix or Apple, which is not named in the suit.

Connectix had no comment.

According to Connectix, the Virtual Game Station will only play about 80 out of the 500 PlayStation titles available, but the ones it will play include the popular Madden NFL 97, Crash Bandicoot and Tomb Raider.

The Virtual Game Station is scheduled to ship within a few weeks.

At the Macworld show, Connectix executives admitted the software program has some technical limitations -- some of the games occasionally skip video frames -- but only hard-core gamers will notice.

The software, which was expected to boost Apple Computer's standing in the computer gaming market, requires an iMac or Power Macintosh G3. It will not run on older Macs or ones with a G3 upgrade card.

An estimated 17 million PlayStations have been sold in North America, and 50 million worldwide.

<end quote>

Let's hope you can now wipe up the remnants of your strained spinach off your bib, TiFKAS - it only shows that you not only make up "facts" about Atari computers and their users, but you're now making up "facts" about the Apple world in order to bolster your undeniably rotten reputation. Let's see you try to wiggle out of this one.....

Actually, Peter was correct at the time of his post. Immediately after the Connectix Macworld announcement, Sony had not comment. They then indicated that then might sue Connectix but later announced that they saw no reason to do so. Finally, they announced that they are, in fact, sueing Connectix.

In their latest press release, Sony says that they are not concerned that their IP was used to develop the emulator (their original concern) but they are concerned that the emulator "circumvents the PlayStation's anti-piracy protection technology".

Figures, I have a copy of Apex Media that came with my computer. There was only
one disk with it, and the other is missing. I will have to keep my eyes open
for these things.

>
>What facts did I make up?

claiming that "90% of all TOS applications fall over on the Milan", before the computer was even released.

Claiming "Calamus is Crap" when you never even used it.

Claiming that Sony was going to do a licensing with Connectix on Virtual Game Station (which Sony denied in their press release).

>And yes you are 'Chunks'...

nope, there's no one here by that name. Better go to your
psychiatrist to get your Ritalin prescription refilled.....

    1) no one here named "Chunks", man....

    2) even if  there  was, it  certainly  shows how  mean-spirited  and
vindictive you  are  in  making fun  of  those  who you  may  think  are
unsightly, even when sight-unseen, when it is obvious you are losing any
argument you involve yourself in - the same goes for your well-expressed
contempt for those in  the labour force. Did  you also pick on  crippled
kids when you were little?

>kicked out a vendor when it was not true..Did I call you a liar...You were
>missed informed..

again - Crawford expressed a categorical denial. The issue deals with TechWeb, which as of yet has still to withdraw the story - and upon whom rests the proof of the pudding. Until such, you have no case.

BTW, it's spelled "misinformed". I may be "just a veep", but I can spell....

And talk about jumping the gun.....

>>>At the time they did not..
>>
>>   but they eventually did. And they didn't do a license deal...
>
>Fell through. I bet will settle out of court..

again, Sony DENIED THAT THERE WAS ANY DEAL. IT IS IN BLACK AND WHITE. Talk about speculation....

>
>>>>   well, Think Again, TiFKAS - here's the news from January 28th -

something you should also remember, TiFKAS - the one who wets his pants when the iMac comes out in new colours! :)

>
>Underachiever! Just a veep!

ahh, but the day may come when I do become president - I'm just biding my time when the conditions get right. Whereas YOU will always remain a two-bit moron who is a target of derision for all right-thinking computer users - let's face it, even Mac users think you sorely need a life!

BTW, being "just a veep" has certainly gotten some notice from the various interviews I've been involved in. People outside of TAF have been quite impressed.....

Not enough sales. Atari was sold to JTS which just recently sold the name to Hasbro. If you had purchased an ST in 1985 you could at least be on the internet with an Atari product:-). Yes, jaguar was last games machine made. It was introduced early and sold to little to late. Very unfortuneate.

Many great Atari ST/TT/Falcons were made until 1995-6? Today these TOS (The Operating System) computers are still being made in more powerful configurations. These manufacturers are based and Europe. Hades/Medusa are being made by a company I cannot remember. And the Milan is the other machine.

While many developers have had years and years and years to leave Atari, there are still quite a few new products being developed. These powerful applications should easily keep Atari USers going into the millenium.

As for users, the same is true. While more users have left than stayed, the surpluss of machines creates a bargain for atari enthusiast who can get alot of power for very little investment. This to me is the true appeal of the ST. There are not many 14year old computers that can view, avis, jpegs, mpegs and ahve a graphical webbrowser.

Well, how is that for a bit of trivia.
I would give a list of websites for real background, but I don't have them handy.

Brian.

What the hell kind of name is "Peter Sinclair Day" any way. It sounds like the name off of some sort of feminine napkin package.

Mike

As I watched the new iMac commercial, I couldn't help but think that if the
Atari CEO's had a little more forsight, those could have been dancing Falcon
PPC's on the screen.......

Without going into a lot of details (there are plenty of other experts here), I think after the loss of revenue from Jaguar returns about a year or so after it's release, they tried to invest what capital they had left with a company called JTS (hard disk manufacture). JTS really didn't have much to do with the Atari name, but I think did continue to liquidate the Jaguar. JTS was going bottoms up and the investment that the Tramiels make probably just went it to the negitive side of

Atari's tax rolls. Hasbro now holds the copyright to the name "Atari"
(not the arcade brand name). I have seen a few "Atari" games at
WalMart lately from Hasbro for PC's.

How would you know?

What kind of name is Mike Sh_t?  Used toilet paper?  When your mother gave a
```

name to you is it based upon when she wore army boots to kick the sh_t out of you? Would explain the last name..

By the way...maybe in noncommunique for the week. Stop by building 4 and say hi..

-----------------Find Anything On Anyone --------------

____

http://www.producthouse.com/netspy ____________________________________

Now anyone can become an online sleuth. NetSpy shows how to get access to files and data available for years to credit firms, lawyers, research companies, government agencies, and "snooping" firms. Special "how-to research and investigate" sections are complemented by a guide to special databases and complete coverage of all the major on-line services.

Netspy contains almost everything you need to know to find out just about anything about anyone by using freely available information sources on the Internet. It also contains good basic information on the role of the Net in corporate espionage and explanations of of secure financial transactions online.

Even if you find snooping about other people distasteful, you should get this book to find out what others can find out about you--and how you can cover your digital tracks on the ever-widening silicon beaches surrounding the continents of our existence. Very Highly Recommended

NetSpy shows how to get access to files and data available for years to credit firms, lawyers, research companies, government agencies, and "snooping" firms. Special "how-to research and investigate" sections are complemented by a guide to special databases and complete coverage of all the major on-line services.

<<snip>>
I remember that there used to be an application called "STeve" around. It too was Office-like / Works-like. There also was a Pro version that could do some OCR.

Don't know where it went or is to be bought these days, sorry.

Cool, we broke his brain :)

It appears that, rather than face and answer the facts, TiFKAS has morphed into Eric Cartman - again. Mummy didn't buy you your Cheezy Poofs?

>By the way...maybe in noncommunique for the week. Stop by building 4 and say

Sorry, the staff at Bellevue Mental Hospital say that visitors are not allowed at Building #4 due to the amount of high voltage required for your particular case. :)

A certain chunky jihad has been a critic of Apple's implementation of USB and the disregard of the old legacy ports like ADB and SCSI...And claims it would bite Apple in the behind..

Not surprising that chunks is wrong again. The latest USB registry shows that there are more USB products than were for the old Apple ADB ports. This also includes midi. Chunks declared that the midi makers would flee the Apple market. Guess again...Saw demonstrations of USB midi devices in all it's glory at you know were today...

Check...http://www.apple.com/publishing/music/midi/

A certain Jihad claims that the Hades/Milan are highend and lowcost publishing tools. Guess again....Do these beige boxes use the latest in publishing and digital editing technology that is on par with colorsync and firewire? You have seen nothing like this on these beige boxes..When will these have this kind of features?

ironically, it was also reported at January's NAMM that while USB-to-MIDI devices were coming, many of the companies producing them were coy about coming up with Apple drivers. One hopes that they'll eventually show up.

They have MIDI demonstrations at Bellevue Mental Hospital? :)

read em' and weep, weinerhead....anything you can do we can do better...BTW, Papyrus 7 has now come out, and will blow your socks off WITHOUT the bloat of programs like Quark....

Oh yes, '060 version of Milan is to be made available next month, and MagiC for Milan is coming soon. And all with true pre-emptive multitasking, which Apple's OS still hasn't accomplished after all these years....

BTW, we hope the shock treatments you're currently receiving at Bellevue will soon rid you of the delusions you've been having about imaginary "Jihads" who are "out to get you", as well as your imaginary friend "Chunks". Of course, the orderlies will have to make sure you're completely cured before they allow you to publish your drivel on the internet again .

Dear Madam, Dear sir,

We are proud to announce you the CENTurbo II B will be ready to be sold the sixth week (February, 8-12)

Here are the new features:
- New 4 layers optimized PCB with EMI protection.
- New faster EDO BURST Fast-Ram controller from CENTEK:
    - 16, 32, 64 or 128 MB with ONE 60 ns EDO 32-Bit SIMM.
    - BURST READ with 5,2,2,2 cycles (6,2,2,2 on CT2 A).
    - WRITE with 4 cycles (6 on CT2 A).
- Connection between the CT2 and the F030 motherboard by a ribbon cable: the CT2B can be removed and changed without solders.
- New faster software (English & German) with new features into the Flash.
- New installation documentation (English).
- New software in the package (English).
- SERIAL port & FPU problems (certain CT2 A) are fixed. (the fix is available for CT2 A).

All the informations are NOW AVAILABLE on our
WEB site: www.centek.fr.

Have a look on our incredible performance tests with:

PAPYRUS 7
PHOTOLINE 2.24
POV 3 (vase script)
SANDRINE 4.0

GCC 2.7.2
PURE C
DEVPAC 3.10

CUBASE 2.06
V-TRAX 1.0
FIVE TO FIVE 2.13

CAB 2.7
ST ZIP 2.6

Please, see our distributor list to know your local distributor.
If you have no distributor, you can buy at Centek with the
following prices:

- CT2 B (no RAM)	289 euros (Inc. French VAT at 20.6 %)
- 16 MB EDO SIMM	45 euros
- 32 MB EDO SIMM	83 euros
- 64 MB EDO SIMM	contact us
- FPU 68882-33	38 euros
- Installation	45 euros (send your motherboard alone + IDE cable)
- Transport	contact us

The last news about the PHENIX 040/060

At the end of December, at the very time when the E15 version of the PHENIX motherboard was ready to be produced for the developers, CENTEK decided to bring some important changes about the hardware architecture of this motherboard.

Here is the list of the major changes introducing the R1 (Rev.1) version of the PHENIX 040/060:

- The DSP56301 is now connected on the PCI bus.
- A card with 3 other DSP could be plugged into a PCI slot, not into a dedicated slot.
- The ULTRA-SCSI and USB (2 ports) controllers have been replaced. The new ones are connected on the PCI bus.
- Two IDE (ATA-4) connectors are now officially provided thanks to a new component on the PCI bus. Four peripherals are so possible.
- The MIDI, SERIAL & // ports are suppressed. They are possible with some USB interfaces, opening the way of the future.
- The QUICC chip is suppressed.
- The EDO RAM is replaced by the SDRAM; it is 2 times cheaper and 2 times faster (with the 060).

Why these modifications ?

The first objective was to reduce the production cost: the suppression of the QUICC and the transfert of some functionalities on the PCI bus (to reduce the programmable logic cost) follows this objective. The reduction of the cost continues actually to equilibrate the cost of the performances increase.

The second objective was to take in count the remarks of some developers (like Soundpool) in the domain of the DSPs. They was wishing to have faster transferts between the DSPs. With the DSP on the PCI bus, the hardware architecture is optimum.

At CENTEK, we were wishing to reduce as much as possible the necessity of the CPU use to transfert the DATA. For that reason, the USCSI and USB are too on the PCI bus.

The performances ?

Imagine the heavy task that reads a movie from a DVD disk. The hard disd drive (HDD) (Ultra-SCSI or Ultra-IDE) transferts the AUDIO and VIDEO DATA (MPEG2) to the controler (USCSI or IDE) that transferts on the PCI bus with BURST at 132 MBytes/s to one DSP56301 to uncompress (real time) the AUDIO and one (or more) other DSP to uncompress the VIDEO.

Each DSP sends the results to the final destinataries:

- the AUDIO to the 20-Bit CODEC (on motherboard) by the DSP-CODEC serial link.

- the VIDEO to the GRAPHIC card by the PCI bus at 132 MBytes/s (BURST).

Conclusion: no important CPU intervention which continues to run into the system SDRAM on the other side of the PCI-040 BUS bridge ! This is the undebatable superiority of the PCI architectured computers, not like the simple 'PCI as peripheral' architecture !

Have a look on our functional block diagram.

The final objective was to draw nearer to this total PCI architecture faster than it was previously planned to easely introduce the new future computers like the PHENIX 2 (code name). The PHENIX is now comparable with the architecture of the last generation of PC.

The choice of the new PCI components was the principal reason of a new delay to terminate the motherboard. We now terminate the PCB routing...

Here is the substance..Not like the Milan using yesterdecade tech...

Processor
300-, 350-, or 400-MHz PowerPC G3 processor
512K or 1MB backside level 2 cache on processor, running at 150, 175, or 200 MHz depending on processor speed
100-MHz system bus
Integrated floating-point unit and 64K on-chip level 1 cache (32K for data and 32K for instruction)

Memory
64MB or 128MB of PC100 SDRAM (3.3-volt, unbuffered, 64-bit-wide, 168-pin, running at 100 MHz)
Four DIMM slots support up to 1GB of PC100 SDRAM using the following DIMMs:
�32MB, 64MB, or 128MB DIMMs (64-bit-wide, 64-Mbit technology)
�128MB or 256MB DIMMs (64-bit-wide, 128-Mbit technology)

Storage*
One of the following:
�6GB Ultra ATA hard disk
�12GB Ultra ATA hard disk
�9GB Ultra2 LVD SCSI hard disk with Ultra2 LVD SCSI PCI card
24x-speed (maximum) CD-ROM drive; or 5x-speed (maximum) DVD-ROM drive with DVD-Video playback (reads CD-ROMs at up to 32x speed)
Zip drive (some configurations)
Two additional expansion bays for Ultra Wide SCSI, Ultra2 LVD SCSI, ATA (IDE), Ultra ATA, or ATAPI drives (including CD-ROM, DVD-ROM, and Zip drives)

Interfaces
Connectivity
�Two 400-Mbps FireWire ports
�Two 12-Mbps Universal Serial Bus (USB) ports
�Apple Desktop Bus (ADB) port (maximum current draw for all ADB devices is 500 mA)
Communications
�Built-in 10/100BASE-T Ethernet

connector (RJ-45)
�Optional internal 56K modem card
(supports K56flex and V.90 standards)**
Expansion
�Four PCI slots: three 64-bit, 33-MHz
slots and one 32-bit, 66-MHz slot
dedicated to the ATI RAGE 128 graphics
card
Video
�15-pin mini D-Sub VGA connector and
Macintosh-to-VGA adapter
Sound
�Minijacks for 16-bit stereo audio input
and output; 44.1-kHz sampling rate
�Built-in speaker

Graphics support ATI RAGE 128 graphics card with 16MB of SDRAM graphics
memory, which provides the following capabilities: 2D performance �128-bit
internal engine �Hardware acceleration of graphics and video
�Support for
up to 1,920- by 1,200-pixel resolution at 32 bits per pixel (millions of
colors) 3D performance �Advanced integrated triangle setup engine
�Single-pass multitexturing design �Full 32-bit-per- pixel (bpp) Z buffer
and 8-bpp stencil buffer �Robust support of QuickDraw 3D RAVE and OpenGL

> Terry Ross - and yes, I did view it with CAB.

I doubt that many ST jihads were aware that there are multiple Atari shows.
Please post the schedule..Maybe there will be one in the Twin Cities soon
right around were I live in Eden Prairie...

You can impeach a salami sandwich... The President was impeached by partisan
Repubs who hate Clinton's generation... Will be upto the cooler heads in the
Senate to acquit or convict..The first will be likely..

It's not wasted mentality but prudence.. Fine they belong in the homes of the needy and the less priveliged ones but not in the schools who are serious about education. Students are power users unlike a certain jihad clan that sticks to the past..

They can have the budget they plan and sell it to the community. Many schools who take education seriously instead of sports will get the money through increased property taxes, levies or generous alumni..

Doesn't solve anything...what about multimedia. Schools use MULTIMEDIA...A 286, a 386 and 486 or 68k Mac will not cut it..

> As for 386s - well, I believe that a donated 386 system with Linux

Apple took the bondi-blue off MAP according to the news organizations. Thats
means retailers can charge what they want. CompUSA has it priced at $999 now.

> Here is the substance..Not like the Milan using yesterdecade tech...

Hmmmmm, here is some more 'substance' -

I finally broke down - and bought, on Jan 2, a non-iMac Mac G3-233
with 96mb of RAM and OS 8.5 - on Jan 6th it went back to 'the shop'
where, after 48 hours, they finally told me the 'logic board' needed
replacement - I hope - I reaaaaaly hope - I haven't bought trouble -
my Atari Mega/STE has been running since 1991 without service other
than to replace the ROM OS (upgrade only) and reseat the chips last
year -

Tell me, pleaaase, this is not a standard game on Mac - the Macs at
the office were less prone to troubles than the PeeCees - has that
changed.

And, when I get it back, I'm going to be searching for an Atari
emulator - some of the Mac software is bloated crap compared to Old
Atari software

The Canadian Curmudgeon (in almost sunny, -3C, Calgary)

     Yesterdecade tech with better engineering will always
     likely trump the latest and greatest that's all style
     and no substance.

[deletia]

BTW, those weren't hardware specs for iMacs.

So, you felt it necessary to PROVE to everyone that you either can't read, period - or that the mechanics of actually comprehending what you've read is beyond your grasp? It really wasn't a requirement that you attempt to prove my hypothesis you know, we're all quite aware that you've got the intellectual facilities of your average head of cabbage.

Better cut your fingers off there guy.... old tech... toss your heart... chop off your head... oh, wait, on you that qualifies as a vestigial organ anyway....

> Processor 300-, 350-, or 400-MHz PowerPC G3 processor 512K or 1MB backside level 2 cache on processor, running at 150, 175, or 200 MHz depending on processor speed 100-MHz system bus Integrated floating-point unit and 64K on-chip level 1 cache (32K for data and 32K for instruction)

Gee, almost fast enough to convince people you're not running your bloatware on a 286. Maybe in 15 years you'll have something fast enough to make it worthwhile.

>
> Memory
> 64MB or 128MB of PC100 SDRAM (3.3-volt, unbuffered, 64-bit-wide, 168-pin, running at 100 MHz) Four DIMM slots support up to 1GB of PC100 SDRAM using the following
> DIMMs:
> �32MB, 64MB, or 128MB DIMMs (64-bit-wide, 64-Mbit technology)
> �128MB or 256MB DIMMs (64-bit-wide, 128-Mbit technology)

Yup... too bad it's necessary.... don't you hate having your simple 4-function calculator require 6 megabytes of memory, and an additional 2 megabytes for the help file? Does it occur to you that entire governments were run on 32K systems? What does that tell us? Simply that your Macs must be pretty darned inefficient there fella.

> Storage*

One of the following:
�6GB Ultra ATA hard disk
�12GB Ultra ATA hard disk
�9GB Ultra2 LVD SCSI hard disk with
Ultra2 LVD SCSI PCI card
24x-speed (maximum) CD-ROM drive; or
5x-speed (maximum) DVD-ROM drive
with DVD-Video playback (reads CD-ROMs at up to 32x speed)
Zip drive (some configurations)
Two additional expansion bays for Ultra
Wide SCSI, Ultra2 LVD SCSI, ATA
(IDE), Ultra ATA, or ATAPI drives
(including CD-ROM, DVD-ROM, and Zip drives)

I'm impressed.... that should suffice for your bloated Operating System - what devices are available for actually storing applications & data? Do you even know what a gigabyte is? Why in the name of Charles Babbage do you think you need that much storage space? Because you've got a monster on your hands that will continue to suck up anything you throw at it. I'm waiting for the day when your 3-Terabyte drive drive crashes, forcing you to use a pen and paper because you've lost your word processing App.

Oh, there are lots of them, and people want them. See, PC's and Macs

decided to embrace bloatware where you can't even display an ASCII
text file in a reasonable amount of time without a 500mhz Alpha chip
so the 060's have been used by the companies who actually know how to
make a computer and OS.

No Problem. The image works fine. 4Mb RAM machines might choke due to the sheer size of this image but who is stupid enough to put 1500x1200 odd size JPEG
images on a webpage anyway! All that does is waste bandwidth...

Sorry to lower the tone of the conversation but has anyone seen the new Apple G3 minitower? Wow, now there's a nice piece of kit. If only you could get it in different colours like the iMac and it was 100% compatible with the PC I might have bought one!

For the moment I shall have to stick with my P133 and TT.

Also has anyone read "APPLE - The Inside Story of Intrigue, Egomania, and Business Blunders" by Jim Carlton? Apart from his, at times, obvious religious Apple furvour it is a great read. Just how similar can Atari and Apple get in their day to day dealings!!!

Spencer

What soundchip does the 1040STfm use?
More importantly, why is the sound output more like that of a C64 then an Amiga?.

MODs sound awfull, as does game music when compared to the same game versions on the Amiga (Xenon II megablast for instance). Did the STfm use the same soundchip as the 520ST's?.
I'm curious because I thought that even early Atari's had great sound output, which is obviously not the case.

Can anyone shed some light on this subject for a Amiga user who has recently aquired a 1040STfm?.

I was going to use it as a MOD player but that seems pointless.

Regards,

Clockmeister.

The problem Dick...er sorry! Peter, is that you have no idea how fast -any- accelerated Atari running modern system software (N.aes, MagiC, Mint) is...

It doesn't take kazillions of CPU cycles just to open a window, or move a file. Unlike some bloated memory hogging OS's I won't even mention here. ;-)

BTW, did you know that work is -continuing- on the 68K line? An 80mhz '060 is supposed to be released soon.

->Thats news to me...And Why? Anything new comming out or is it for nastalgia?

I figured it would be...clues for the clueless... ;-)

Of course there is new stuff coming out. There is, and has been year in and year out for a long time. (don't have enough time/space to list it all) ;)

Why? Because us loyal "Jihads" won't quit on a good thing! (Atari-its more than just a computer-its a way of life!�)

BTW, its nostalgia...(iMac reps obviously can't spell as well as not being able to accept reality) ;-))))

->I doubt that many ST jihads were aware that there are multiple Atari shows.
->Please post the schedule..Maybe there will be one in the Twin Cities soon
->right around were I live in Eden Prairie...
->
->Peter S.

I'm sure most the "Atari Jihads" are aware-we were didn't want to tell, afraid that you might show up, and somebody would vaporize you to put you out of their agony... ;-)))

Anyways, lets see...there was the Deuce show, held by A.U.N.T, which just occurred in November of this year. There were 2 shows in the UK recently, the big Atari show in Germany (messe?), as well as World of Atari '98. (and this is just off the top of my head-I'm sure there were more-with repeats this year) Get the point, O pointless one? ;-)))

>Amiga?.

Because the Amiga has got Paula, which is superior even to 16-bit PC soundcards, due to advanced, reliable technology. The ST's Yamaha chip is more like that of a Master System or other 8-bitters. However, the STE and the Falcon had better soundchips, that of the Falcon even surpassing Paula.

>I was going to use it as a MOD player but that seems pointless.

It's quite pointless. The tracker module is essentially an Amiga format, and
doesn't work particularly well on any other platform.

Actually, the '060 is quite popular in not only personal computers but in
embedded devices. Motorola has been having a hard time keeping up with demand.

Take you business elsewhere, preferably to alt.nuke.the.USA, where you'll
learn some proper flaming and advocacy behaviour.

For once, Peter is right. If I detected anything but an Amiga or a clone thereof at AmiTech, I too would be upset, although I suspect Petro Tyschtschenko and Amiga International would be more humble about it.

>Goto PCExpo, Comdex or Amiexpro or maybe a once in a decade Atari show...

There are at least three Atari shows every year in Europe, as far as I can tell.

Nevertheless, Java is in reality entirely uninteresting, albeit a nice idea in
theory. The only experience I have of Java in all my hours of surfing is that
the browser suddenly grinds to a halt, nothing happening for half a minute,
since some idiot decided to have a reflection of his logo on a web page.
Hence, I deactivate Java whenever I encounter such a browser.

Yep, they might be able to get their computers. However, that will lead to cuts when it comes to books, teachers and other material. You make it sound very easy, as you always do. You haven't got much experience of what it is like to manage finances, do you? You just get a new PB from your emplyer every six months, but not everyone does.

>>   at the last Comdex here in Toronto, there was an organization called

>Doesn't solve anything...what about multimedia. Schools use MULTIMEDIA...A
>286, a 386 and 486 or 68k Mac will not cut it..

Schools don't use "multimedia". They use word processors. Sometimes, they even use web browsers and compilers for programming languages. Multimedia doesn't include playing MP3 music or Quake.

>>   As for 386s - well, I believe that a donated 386 system with Linux
>> installed would make a great little computer for future programmers in
>> high schools to get started on....

>What about the non programmers.. I see Linux will do more harm than dos did..

The non programmers could actually learn a thing or two, especially if they are not confronted with just Windows, Windows, Windows wherever they go. Knowing how to start Windows and run Word isn't the same thing as knowing computers.

>> >Customers asked for color choices..
>>
>>   over things like floppy drives? How clueless can they get?

>Floppies are available..

Peter, you need but one stop at the end of a sentence. Your double stops do only indicate a vagueness, which of course is quite coreect when it comes to you, Pete.

As for floppies, they are available, but they will do the iMac user no good, since he hasn't got anywhere to insert them. Remember, the IMac is a hermetically sealed environment without any chance of data exchange with the outside world.

I usually see them from $400-$600 dollar depending a memory, HD and any additionals included.   Falcons and TT030's have held up in value. STacy laptops as also held up well, going for anywhere from $350-$500. Mega STe's are going for about $200-$250, Mega ST's for about $100-$200, 1040ST's for about $75 and 520ST's are usually $25 or free sometimes, they have next to no value.

Isn't that the same chip as was used in the ZX spectrum?

That answers my previous question :-)

However, the STE and the
> Falcon had better soundchips, that of the Falcon even surpassing Paula.

Which soundchip does the Falcon and STE use?. Is it a custom device or
another Yamaha chip?.

I have noticed that. I'm not impressed at all with PC trackers either.

Thanks for the info!

Regards,

Clockmeister.

An 060 coupled with an efficient, PMT OS and good system design is quite a speedy solution. The Mac needs oodles of CPU power to compensate for that pathetic OS known as MacOS.
Just why is it that an 060/50 based Amiga emulating a Mac approaches the speed of a real PPC Mac?.

An 060 is a nice solution for both the Atari based and Amiga platforms and the chip demand is surpassing supply by a fair margin.
Not to mention the fact that the 060 continues to be developed further, mainly due to user demands.

Regards,

Clockmeister.

The Atari ST sound chip is the same cheap old Yamaha FM chip that was used in the ZX Spectrum and Amstrad CPC. Even the C64's SID chip was far better than the Yamaha.

> MODs sound awfull, as does game music when compared to the same game
> versions on the Amiga (Xenon II megablast for instance). Did the STfm use
> the same soundchip as the 520ST's?.

Yes, of course it did. An STFM is just an ST with integrated floppy drive and RF TV output, nothing more.

The STE was the improved machine, where they fixed the weaknesses that the ST had compared to the Amiga. Among the other changes, the STE has a stereo DMA sound system comparable to the Amiga's, but it was too little, too late and very few game editors bothered to write STE enhanced versions of their games.

> I'm curious because I thought that even early Atari's had great sound
> output, which is obviously not the case.

No, they didn't. BUT they were great for professional music applications. Musicians use MIDI synths and expanders, and even though the Amiga had a better sound system, it was still useless for pro or semi-pro musicians who wanted rock solid MIDI.

>
> Can anyone shed some light on this subject for a Amiga user who has
> recently aquired a 1040STfm?.

The Yamaha soundchip was definitely one of the ST's weak points. As I said, they fixed it with better hardware in the STE.

For an idea of what the STE is capable of, you should try Obsession

Pinball on an STE.

>
> I was going to use it as a MOD player but that seems pointless.

If you have an Amiga, then probably it is. Get an STE with Octalyzer or
some other STE-only MOD tracker, and taste the difference.

Yep, and the Amstrad CPC.

<snip>

> However, the STE and the

The STE (and Mega STE/TT) have a custom Atari DMA chip. It was designed specifically for playing stereo samples from Direct Memory Access, at any sample rate. As I said in my previous post, it was hardly ever used in any games. There are quite a few STE-only MOD players around that are quite good.

In addition to that, the Falcon has a completely new sound system, known as the "sound matrix" which allows you to send various inputs (mic, ADC, DMA, etc...) and outputs (speaker, headphones, DAC, DMA..) through the DSP. This allows to do things that couldn't be imaginable on the Amiga, like harddisk audio recording in sync with MIDI, while adding effects through the DSP. If only the DAC/ADC had been better, the in/outs would have been at line level and the fixed clock rates would have been the industry standard 44.1 KHz.

So Atari included MIDI ports but neglected to add a decent sound chip.
Quite ludicrous really.

Men at work (the band) might disagree here, but anyway...

I'll keep my eye out for a STE then ;-)

Thanks for the info.

Regards,

Clockmeister.

to here I disagree. Intergraph is a company that makes servers, and their servers are very Mac friendly - hence their booth at MacWorld. However, after hearing Jobs make another one of his fatuous claims - this time about Mac OS servers being able to toast PC servers, and using what Intergraph saw as a flawed test. Intergraph decided to do another test at the show that compared their systems to the new Apple servers.

Now this would have been perfect for Apple had they been able to substantiate their claims using another competing product - even if they broke even, it would have given them some credibility as to their claims. Instead, afraid of having a huge hole pop open in the Reality-Distortion Field�, Steve simply had another of his infamous hissy fits and used his leverage with MacWorld to have Intergraph removed.

Indeed, the question remains - if Intergraph's actions and product were not appropriate for the show, then why let them in the show in the first place?

Jobs has not been getting good press over this. Indeed, it's making him look quite bad. Here he is at a position where Micro$oft is in serious loss of credibility, a situation where Jobs can make some great inroads - the last thing he needs is to start using Gates-like tactics to silence his critics.

Wanted: a stable O/S for Intel oriented computers which will obselete the Microsoft Abominations.

[End User License Agreement: By opening this message you show your agreement to spend the rest of your life vigorously opposing the oppressive Microsoft marketing philosophy.]

The instability of Windows Operating System, and the inability of the operator to re-install major portions of the O/S without re-installing the entire O/S, maintains an ever-present menace to periodically flush out information, indescribably important to the user.

Backups are no solution in a market which produces ever-increasing hard drive capacities when Microsoft maintains perpetually expanding products which render the new capacities little more helpful than the older smaller drives.

Microsoft will not include proper correctional procedures as to allow the operator to correct the notorious anomalies which are guaranteed to crop up in the O/S, without phone contact to Redmond Washington. Neither the demur manual, NOR the on-line Help avails the correctional procedure to the Operator. For example, trying to look up the word �reinstall� in the help window yields no solution to reinstall some component of the O/S.

There is the option of calling Microsoft help personnel and paying long-distance phone charges to have them direct the operator through the esoteric steps of addressing the pertinent cabinet files, but this increases the price of Windows from $89.00 retail, to something on the order of $300.00 to $600.00 per year, to keep the O/S in its normal unstable operability.

Microsoft offers no 800 or toll-free numbers for help. Microsoft is such an oppressively wealthy company that it is publicly contemptuous for them to fail to offer toll-free technical support as do much smaller vendors who are much less able to afford this overhead. There should be an investigation to determine any collusion between Gates or Microsoft and Telecommuications Companies.

For Bill Gates to have $65 Billion (not a current figure) taken from customers for the shoddy unservicable products he has sold should be legally defined as theft. Gates� wealth if properly distributed could more purposely provide the new Apple �IMAC� computer to 65 million individuals. Apple Computers with their more conscientious marketing philosophy would more ethically deserve the business.

The Microsoft product upgrade procedure follows a successful formula of releasing a shoddy, unreliable, unstable product, generating profound sums of capital wealth, followed by a corrective �upgrade�, equally lucrative, which, although it may fix some former problems, includes so much new feature content (which will require an equally lucrative future corrective upgrade) with commensurate shoddiness and instability, that the use of Microsoft Software is a pattern of upgrading from one instability to another, ostensibly for the purpose of perpetually genereating regeneratively snowballing Income.

Microsoft products are not ingenious. They are normally complex application softwares which are made more complex through the inclusion of protective devices which insure the company and its founder that it will not miss a penny. Microsoft is obviously and definitively taking advantage of a market allegiance which exists for no other reason than that it has always released software prematurely for the purpose of getting to market ahead of competition. There cannot be the option of buying a shoddy product first, and then improving with the advent of competitor�s software, due to the high price of software, and the education curve of switching.

What is reliable in Microsoft�s products is the guarantee that you will spend more time wiping them than you will spend in the toilet during your lifetime. Tens of millions of users, perhaps hundreds, lose hundreds of man-hours each year compensating for Microsoft�s marketing philosophy.

Bill Gates has visited more trouble on mankind in 20 years than millenia of efforts by any villains, mythical or otherwise, such as Satan, Lucifer, Beetle Juice, or Ron Hubbard. One can only hope that Gates� damnation of humanity will not be eternal. Like so many other consumers, I have spent a hellfire of time compensating for a greedy marketing philosophy, oppressive of competition. Multiply this by the hundreds of millions of computers in existence to comprehend the extent of the inferno.

David Alexander

>
> The instability of Windows Operating System, and the inability of the operator to re-install major portions of the O/S without re-installing the entire O/S, maintains an ever-present menace to periodically flush out information, indescribably important to the user.
>
> Backups are no solution in a market which produces ever-increasing hard drive capacities when Microsoft maintains perpetually expanding products which render the new capacities little more helpful than the older smaller drives.
>
> Microsoft will not include proper correctional procedures as to allow the operator to correct the notorious anomalies which are guaranteed to crop up in the O/S, without phone contact to Redmond Washington. Neither the demur manual, NOR the on-line Help avails the correctional procedure to the Operator. For example, trying to look up the word �reinstall� in the help window yields no solution to reinstall some component of the O/S.
>
> There is the option of calling Microsoft help personnel and paying long-distance phone charges to have them direct the operator through the esoteric steps of addressing the pertinent cabinet files, but this increases the price of Windows from $89.00 retail, to something on the order of $300.00 to $600.00 per year, to keep the O/S in its normal unstable operability.
>
> Microsoft offers no 800 or toll-free numbers for help. Microsoft is such an oppressively wealthy company that it is publicly contemptuous for them to fail to offer toll-free technical support as do much smaller vendors who are

> much less able to afford this overhead. There should be an investigation to determine any collusion between Gates or Microsoft and Telecommuications Companies.
>
> For Bill Gates to have $65 Billion (not a current figure) taken from customers for the shoddy unservicable products he has sold should be legally defined as theft. Gates� wealth if properly distributed could more purposely provide the new Apple �IMAC� computer to 65 million individuals. Apple Computers with their more conscientious marketing philosophy would more ethically deserve the business.
>
> The Microsoft product upgrade procedure follows a successful formula of releasing a shoddy, unreliable, unstable product, generating profound sums of capital wealth, followed by a corrective �upgrade�, equally lucrative, which, although it may fix some former problems, includes so much new feature content (which will require an equally lucrative future corrective upgrade) with commensurate shoddiness and instability, that the use of Microsoft Software is a pattern of upgrading from one instability to another, ostensibly for the purpose of perpetually genereating regeneratively snowballing Income.
>
> Microsoft products are not ingenious. They are normally complex application softwares which are made more complex through the inclusion of protective devices which insure the company and its founder that it will not miss a penny. Microsoft is obviously and definitively taking advantage of a market allegiance which exists for no other reason than that it has always released software prematurely for the purpose of getting to market ahead of competition. There cannot be the option of buying a shoddy product first, and then improving with the advent of competitor�s software, due to the high price of software, and the education curve of switching.
>
> What is reliable in Microsoft�s products is the guarantee that you will spend more time wiping them than you will spend in the toilet during your lifetime. Tens of millions of users, perhaps hundreds, lose hundreds of man-hours each year compensating for Microsoft�s marketing philosophy.
>
> Bill Gates has visited more trouble on mankind in 20 years than millenia of efforts by any villains, mythical or otherwise, such as Satan, Lucifer, Beetle Juice, or Ron Hubbard. One can only hope that Gates� damnation of humanity will not be eternal. Like so many other consumers, I have spent a hellfire of time compensating for a greedy marketing philosophy, oppressive of competition. Multiply this by the hundreds of millions of computers in existence to comprehend the extent of the inferno.

OK, OK, I admit it. I contributed to all of this. I once bought
Atari Microsoft BASIC for my Atari 400 & 800s, way back in '80 or '81,
and I've been feeling guilty about it ever since....

Even better yet, run Linux/Unix on the PC hardware. (or Mac hardware). Of
course the best solution is to use Atari hardware with Mint (unix) as the
OS... ;-)

-> > Wanted: a stable O/S for Intel oriented computers which will obselete the

I have been in the process of adding a section on my web site for the Atari line of PC Compatible systems. I managed to track down some old black & white photos last week, and I scanned/posted them on my site yesterday.

I did manage to track down some information on the PC-1 system from a review in an old issue of COMPUTE! magazine. However, I can't seem to find any information on the other systems. Specifically, I am looking for the Processor type, RAM, expansion capabilities, etc. In a nutshell, I need all of the hardware specs.

The ABC N386sx laptop looks almost identical to the old Epson laptops that I used to service years ago. Can anyone confirm/deny that Epson built these systems for Atari?

Do any spec sheets exist for these systems? The specific models that I am looking for are the PC-2, PC-3, PC-4, PC-5, and ABC line.

Mike Stulir

Irelevant...Just covering up the fact that the TOS hardware and software are
eons behind..

What PPC Mac are you referring to? Thats a vague statement. Are you telling
me that the 060 Amiga is as fast as a G3/400 model?

> An 060 is a nice solution for both the Atari based and Amiga platforms and

Time to see your psychiatrist, TIFKAS - your imaginary friend
"Chunks" does not exist......

As well, here's a repost of the original story to show you that
Intergraph WAS kicked out of the show....I'd suggest you read it again,
this time slowly so your feeble little mind can better understand the
issues here....

Macworld Kicks Out Intergraph
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

(01/06/99, 3:28 p.m. ET)

```
By David Richards, Computer Reseller News
SAN FRANCISCO -- The organizers of Macworld Expo, held here, have stopped
                                                             ^^^^^^^^^^^^
workstation manufacturer Intergraph Computer Systems from displaying
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Intel-based systems at its booth.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Intergraph, whose booth is located next to Apple's on the show floor, was
set to demonstrate new Intel Xeon workstations running at 400-MHz and
450-MHz chips on Microsoft Windows NT-based multiprocessor workstations.

Sources said this conflicted with Apple's focus on its next-generation
family of Macintosh G3 desktop systems, which are designed to compete with
NT machines.

"We warned Intergraph prior to arriving that they could only run a
Mac-clone environment running off an Intergraph Windows NT server," said
Colin Crawford, president and CEO of Macworld Expo, a unit of IDG Expo
Management Company. "What they turned up with was Windows NT workstations
expecting to run them in a Mac-only environment. This was a sensitive
issue: Apple didn't want it, I didn't want it, and we had to negotiate on
it."

"It was unethical of them to turn up at a Mac function trying to woo Mac
people to a Windows NT platform," Crawford added. "They were warned and
                                                   ^^^^^^^^^^^^^^^^^^^^
now they have been banned. It is not our fault." IDG refused to comment.
^^^^^^^^^^^^^^^^^^^^^^^^^

But an IDG insider who asked not to be named said Intergraph would be
compensated for having to leave because IDG feared a lawsuit. The source
                ^^^^^^^^^^^^^^^
also said IDG enforced a clause in the contract that gave IDG the right to
remove from Macworld anyone it deemed wasn't acting in the interest of the
event. During his keynote Tuesday, Apple interim CEO Steve Jobs boasted
about a powerful new 400-MHz G3 workstation, comparing it to an
Intel-based workstation similar to what Intergraph was planning to
demonstrate.

An Intergraph employee, who asked not to be identified, was skeptical
about Jobs' demo.

"I would like to run the demo again on our systems, this time running ours
or SGI's [Silicon Graphics Inc.] proprietary accelerator cards," the
Intergraph employee said.

    When asked whether it was good business sense to
market NT workstations to Mac users, Macworld's Crawford said, "It may be
smart in their eyes, but I think it is plain dumb at a Mac function. I was
                                                                     ^^^^^
under pressure from Apple, and we had to act."
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
```

This is not the first time Intergraph has used Macworld to attempt to lure Apple's core user base -- publishing, graphics, and design professionals -- to its workstations.

At both Macworld events last year, Huntsville, Ala.-based Intergraph stationed company representatives at many nearby hotels and on corners to pitch its products as an alternative to the Mac.

>> mainly due to user demands.
>
>What user demand?

what Apple Power Rep? Surely you should be keeping up with developments at Motorola to be at an advantage in the ever-changing computer world. But then, it's hard to do that when you insist from hiding from the truth by keeping your head "up there"......

>
>"Macintosh: We may not get everything right, but at least we knew the
>century was going to end." --Douglas Adams

ah yes, Douglas Adams. So when does STARSHIP TITANIC come out for the now-less-but-still-overpriced, now-less-but-still-underpowered iMac? (Hint - see Adams' official web site for why you won't see one.....)

Indeed, TIFKAS acts like a particular Adams character, Wowbagger the Infinitely Prolonged - and is just as pathetic.....

(clue to TIFKAS - check out the beginning and end chapters of LIFE, THE UNIVERSE AND EVERYTHING for what I'm talking about, available from fine bookstores everywhere).....

Found it funny that no Apple G3's (or even iMacs for that matter) were represented in the new release of Lost in Space. All SGI stuff on the screen. I guess Apple and it's third party software providers just can't cut it in a professional enviroment. Does that mean Apple has no place in the future? I just happen to think, they didn't show Pennys room. Maybe there was an iMac in there being used as a fish bowl....

I found the movie quite pleasing. I grew up watching Lost in Space on the tube and wondered how bad it could be. There wasn't too much of anything, and enough to make it worth while to tape off my DSS to S-VHS for editing on my Falcon and Expose.

Mike

(I thought the Robot sucked, but the virtual interface was cool as was the rest of the hardware on the show).

well, speaking as a Hamilton boy, I'd have to say that I don't feel all that kindly towards Calgary right now! <grin> Oskiweewee oskiwahwah!

Speaking of Chris and Mac, it would make more sense for him to
concentrate on the bigger market Macs represent here rather than the
Atari market here. He's got a battle to get DA's Layout known to Mac
users, never mind accepted.

Well, in his defense, I'd say I have to agree with his assessment of Don
Crabb. He kind of reminds me of Guy Kawasaki--in many ways a True
MacBigot�, and thus a rather embarassing lieutenant in the ranks of
advocacy. When it gets down to it, the main reason he is pro-Mac is
because he has always been pro-Mac, he built his career on Macs, and
there's no way in hell he's giving up his position of "prestige", no
matter how laughably ignorant he may come across sometimes.

He got a little press by getting into a snit on the MacCentral web site
about how "MacOS X Server is cancelled!!" about a month ago. The FUD
didn't stop until _Steve Jobs himself_ told him that he was _wrong_.

My suspicion, confirmed partly by a message on Apple's MacOS X Server web page, is that Adobe is giving them a hard time with terms for Display PostScript... because of the threat this could represent to its lucrative laser printer-side licensing.

But Don Crabb didn't put his ear to the ground for tidbits. He just got up one day and decided "it's dead!", proving he's reeeeal bright.

It felt dead, It was supposed to ship this fall/ winter and we haven't
seen anything after DR2. The suits at apple took a week to get back to him
(they probaly had to look up rhapsody in the corperate dictionary) It was
and is a valid question to ask Apple. "Is this another broken promise?"

thank you for confirming what I suspected about Don Crabb.

let's face it - when even non-journalists in comp.sys.mac.advocacy can make a better case for the Mac without using over-hyped hyperbole like the unfortunate Mr. Crabb, I think it speaks volumes about his integrity, his competence, and ultimately his credibility. It also confirms that TIFKAS, unable to face the truth about Jobs' overblown claims about the iMac's "ability" to "toast Pentium processors" (which has now been proven false by several tests that DO show how the tests were performed, and give the results of those tests), will clutch at any knee-jerk, gung-ho, rose-coloured-glasses posts from any source, no matter how outrageously bogus, in order to bolster his own sagging credibility and vendetta against all things Atari.

However, I'd say lumping him in with Guy Kawasaki is unfair. Mr. Kawasaki is fairly bright, is a true legend in the Mac world, and at least he is intentionally funny :)

let's see you try to wiggle out of this one, TIFKAS.....

True, and I absolutely agree with you about that. However, for someone in Crabb's position to start crowing about the death of MacOS X Server, without having one scrap of _solid_ evidence other than mounting fear and a strange story from Germany... well, that's seriously irresponsible. It's one thing for us here in the newsgroups to FUD endlessly, but Crabb, now he could do _real_ damage.

I just don't have much empathy for someone who does something like that. Hell, all he does is bitch and moan anyway...

If I posted in comp.sys.atari.st with that info, a jihad bounty would be
posted plus cry baby emails to postmaster..

This is the appropriate area in the usenet advocacy.

I guess 'Chunks' will claim this as a Steve Jobs reality distortion field.

Current PowerMac G3's Sold Out! The Apple Store has the following message:

"Surprised by our success!

Due to extremely strong Q1 sales, Apple has sold
all Power Mac G3 systems available*, including servers and
displays, through the quarter end.

While this is evidence of the strong support for
the Mac platform from Apple's professional customers, it has placed
the units in short supply. Not to worry, in early
January there will be plenty of Power Mac G3 systems, from entry
to high-end configurations, including servers and
displays, to meet your demands.

*The 266MHz Power Macintosh G3 Desktop "Entry
Model" is still available."

Yep...You are right...that is progress. ie...finally the jihads will have
040's that Apple jetisoned years ago..plus a price to boot...indeed that is
progress.

> Atarians only buy REAL upgrades. Do you know how many service packs there

Lets see. Because yoy have about zero upgrade options.. "Who needs
replacement upgrade cycles...thats why I love TOS"

The only MS product I use is Office 98..

and rightly too - as comp.sys.atari.st is a chartered newsgroup which disallows the posting of such MCIBTYC drivel - any complaints against you were justified. But we all know what a boor you are when it comes to nettiquette.

as for being a "crybaby" - well, TIFKAS, you seem to be the one who gets his diapers in a wad when you're so soundly refuted with the true facts....but I sympathize, it must be vexing discovering that mummy has put overripe bananas in the Pablum.....

Still harbouring your paranoid fantasies about imaginary "Atari Jihads" that are "out to get you", I see.
>
>This is the appropriate area in the usenet advocacy.

no argument there. Now if you'd only stop the FUD and start reporting the facts....

Nobody named "Chunks" here, mannnn....

<mindless press release from Apple snipped>

As for MY opinion - well, I'm happy for Apple's success. Now, how many of these were actually sold? Come to think of it, how many were actually MADE?

if they added the claim that "and by the way, these computers smoke
Pentium II 450 mHZ PCs - we don't have empirical evidence, just trust
Don Crabb and our cringing toady Peter Sinclair!", then that would
qualify as a distortion field.

BTW - that's spelled "Steve Jobs Reality-Distortion Field�" -
accept no substitutes! :)

What's shipping today doesn't deliver any relative benefit
until it's time to do some serious number crunching. What
should be user-bound activities still remain user-bound.

Most of what the 'target grannies' for the iMac are supposed
to be interested in in no way benefits from being able to
'smoke a PII/450' EVEN IF true...

I believe that you've transposed the CPUs.

The 1981 IBM PC used an 8088 (8 bit data bus, 8 bit ALU [which would make a second pass over the data when asked to do a 16 bit computation], 16 bit registers, segmented memory addressing [65536 segments of 16 bytes each]).

The 1983/4 XT used an 8086 (which, IIRC, increased the data bus and ALU to 16 bits)

You've got it all wrong. That 512k ROM does EVERYTHING that those other
O.S.'s do. Only with less memory, leaving MORE for applications.

Besides, I get the distinct impressio that you are not quite familiar with the Atari world. If you rely on press releases such as those released or crossposted by yourself to this and other newsgroups, then I know why. You do not know a thing about upgrade and/or update options for Atarians. Let alone PC's. And no, I'm not gonna fill you in, boasting what stuff we got, because you are simply not worth it if you're not going to come to senses or reason anyway. Wouldn't it be easier to take off that salesuniform for a while and be honest to have an intelligent, cogent and openminded discussion about something worthwile, something useful for everyone involved?

I mean, I have nothing against Macs. On the contrary, I'd like to hear more about them. Especially where emulation of both platforms is concerned. And one or two occasional posts - which don't belong here tbh - I don't mind. It attracts some interest - but hey, your press release crosspostings do that too right? Yes they do, but only the flamy and childish "mine is better than yours" and vice versa thing. Are you sure your daddy allows you to sell items that expensive?

Well forget about it. I hope you get my point.

Let's see... Windoze 98 just arrived. Look up the Windoze 98 website. Hey?

Hurrah... the year 2000 hotfix is there. And oh yes - an extra service pack that fixes the problems created by 98 to make FAT32 W95 OSR 2.1 sometimes unaccessible under 98 and other things... come on... I am a network administrator as well as an IT consulting sr. manager and unlike you, it's not my business to sell but to _know_, and, as such, to make the choices made on management level. I'm realistic. I'm an Atari fan yes, but do I advise any of our clients to blindly go out and buy Ataris? Ofcourse not - there is an established market to consider wether I like it or not: that includes thinking different and also considering other options like where and how a system will be used. When it comes to networking, a cheap Ethernet with PC's and NT is usually the way to go. Not in terms of quality, but in terms of quantity and securing a feasible path for the future - because Macs are not going to take over the world within two years, however sad or great that may be. You wanna sell something?

It is MY BUSINESS to know technical and factual stuff, and to read through the advertising mumbo jumbo.

>
>The only MS product I use is Office 98..

Hahahahahahahahah

========>>>>>>> POOR YOU!!!!

or rich you, depending on which way you look at it...!

I guess you don't know my credentials, and I don't intend to hand them to you. You wouldn' understand anything in there...

I supposed they also urged you to buy an extra hard drive and some extra memory huh... for the same functionality as you already had.. (err if you were an Atari user that is ;-)

I am emailing all Atari related sites/newgroups to check out my new page I am working on at http://papabyrd.atari.org

It's an Atari Commercial Archive! If you have suggestions or if you have a commercial that I don't have, please let me know so I can get it from you and post it online with a a review. I always wanted a complete site to go to get this stuff and I always found it scattered around a bit, so I figured it was time to do something about it! This site is not totally complete however all commercials are online and it works OK. I need to optimize it for Netscape, so try to use Internet Explorer if you can, although Netscape works fine too, it just looks funny (need to work on that).

That's my disclaimer, other than that, send me your comments!

Thanks,
scott@papabyrd.com

Please define "meaningful modern upgrade". What are the TOS users (with
the latest upgrades) missing?

>2) Micro Express MicroFlex-c400A, with a Pentium II-400
>
>3) Packard Bell Multimedia 945 with a Celeron-333
>
>First check out the Mhz comparisons. Look stacked much? Right off the bat
>they look scared. Why not compare 233 Mhz PC machines with a 233 Mhz G3
>Mac, eh? I know why: The iMac would blatantly beat its butt.

I don't know why we have to keep explaining this one. There are at least 2 reasons to make such comparisons. First, the Celeron system costs less than the iMac. Most people compare systems on price, so that is a reasonable comparison IMO. Second, Steve Jobs himself invites the comparison between the iMac and the 400 Mhz PII. I quote: "The iMac for $1,299 toasts the fastest PC money can buy at any price--the Pentium II 400," said Steve Jobs, Apple's interim CEO. ..." (http://www.apple.com/pr/library/1998/aug/13fast.html)

>And then lets
>consider their price comparison argument: do their PC machines at such low
>prices include 100 Base-T Ethernet? Nope. Infrared networking? Nope, in
>fact no networking at all.

>6 MB of VRAM? Nope, only 2.

When they tested the iMac it only had 2 MB of VRAM and had the Rage IIc board compared to the Rage Pro in the Packard Bell. So, you say, the iMac is better configured now. True, but so are PCs.

>512 K backside level 2 cache? Nope, only 128K non-backside cache.

LOL! The 128 KB of *on-chip* L2 cache is much faster than back-side cache. Depending on the application, larger may be better than faster, and vice versa.

>USB? Apparenly Nope.

Do some better research. Of course it has USB.

>56K modem? Apparently Nope.

Yes

>Dual headphone jacks? Nope.

If that's important, spend $5 (if that much) on a splitter cable.

>CD-ROM drive of any speed? They don't say.

They don't say because it's obvious that it does. How can you install
most software without a CD? For the record, it has a 32X CD-ROM which
is faster then the iMac's 24X.

>All-in-one portable? No way!

True

>Runs both Mac and PC software? No Way!

Mostly true (there are some 68K emulators), and also mostly
irrelevant.

>Next are the applications they chose, hilarious:

>1) Megalosoft Excel and Word 97 on the PC and Excel and Word 98 on the
>Mac. Yeah right, like Megalosoft ever cared how fast their software ran on
>a Mac. Any child familiar with Macs and PCs will tell you Megalosoft's
>software has been running slower on the Mac for AGES! Some test. Totally
>worthless.

I guess that's why it is one of the best-selling software packages for
the Mac.

>2) Photoshop 5 on a 5 MB and 20 MB image. They don't bother to provide any
>details here, they just say "we applied filters and effects, followed by
>image resizing and color conversion operations." Really. Why? NO ONE
>should be running Photoshop on ANY of these computers! They all have 15
>inch monitors, which no one running Photoshop would use, except of course
>dimwit PC users who don't know better. I would NEVER advise anyone to use
>an iMac for Photoshop. AND add to that what I have to assume is the dirty
>trick they hid from us: That the "filters and effects" were written to be
>native for Intel chips at the request of Intel themselves just so they
>could have a couple tests at which their chips could beat a Mac. Yes, this
>is a fact: Intel went to Adobe and had them rewrite a number of their
>filters to use acceleration built into Intel chips. Sadly Adobe never
>bothered to rewrite the same filters to be native for G3 chips. Again, the
>test is totally worthless.

So what do you suggest?

>So here we have a stacked set of test, and wowie wow, the iMac lost. Big
>surprise.

What would you suggest as a fair test?

>And to really show off their evil look at what they say:
>

>1) "the world can't make up for slow application performance, poor
>sound quality, and no upgrade path."

How does that make them evil? Is everybody that thinks the iMac is overpriced and underpowered evil?

>The slow applications are only the apps THEY CHOSE as faster on the PC in
>the first place.

So, contrary to many other Mac advocates, you are claiming that Photoshop runs faster on the PC than on the Mac?

>The "poor sound quality" is better than any consumer level add-on speakers
>you can buy. Nice try.

It's true. Have you actually listened to the sound on PCs priced at or below the iMac price?

>The "no upgrade path" they refer to is the monitor. Duh. The iMac is a
>portable all-in-one computer, with what PC World admit is a SUPERIOR video
>quality "yielding even focus and sharp, readable text." Of course its not
>upgradable. They are comparing the mobile iMac with a clucky collection
>interconnected boxes.

I guess all non-iMac Apple Macs are just "a clucky collection of interconnecting boxes" as well.

>The stupidest insult: "interim CEO Steve Jobs' boast that the iMac is faster
>than the quickest Pentium II is pure hype--and it falls apart under scrutiny."
>
>WRONG. If they would bother to actually QUOTE what Apple says, and
>actually provide DETAILS about what Apple used for comparison THEIR HYPE
>would fall apart under scrutiny.

They did quote what *Steve Jobs* said: "The iMac for $1,299 toasts the fastest PC money can buy at any price--the Pentium II 400," said Steve Jobs, Apple's interim CEO. ..."
(http://www.apple.com/pr/library/1998/aug/13fast.html)

>What Apple PROVED:
>
>1) The iMac beats even a 450 Mhz Pentium II computer in BYTEmark Integer
>benchmarks. Period. "

How many times per week do you run BYTEmark on your Mac? What do you accomplish when you run BYTEmark on your Mac?

>The G3 runs as much as twice as fast as the Pentium
>II." There is not one bit of hype here, just facts. The hype is the crap
>PC World is trying to con us with.

LOL!

>2) The iMac wipes the floor with a 233 Mhz Pentium II machine when playing
>a Director multimedia presentation. Watching this live on stage
>demonstration, as you can on any retail store demo iMac, is incredibly
>pathetic. The PC was so far behind, was taking so long to complete
>compared to the iMac, that they gave up on it. When the same multimedia
>presentation was played on a 400 Mhz Pentium II machine and a K6 400 Mhz
>machine the results were less devastating, but the iMac beat the 400
>Pentium II by at least a factor of 2, and beat the K2 at what was at least
>a factor of 3.

I have never seen these data published (not even on Apple's web site). I am aware of the demonstration, but I've never seen any actual numbers.

Here are a number of real-world application tests showing a general advantage for PII systems over G3 sytems:

http://www.zdnet.com/pcmag/firstlooks/9808/imac_tests.html
http://www.zdnet.com/pcmag/firstlooks/9810/f981002a.html
http://www2.pcworld.com/pcwtoday/article/0,1510,7801,00.html
http://www.techweb.com/wire/story/TWB19980821S0021
http://www.cnn.com/TECH/computing/9811/09/macvp2.idg/
http://newmedia.com/newmedia/98/09/labnotes/Apple_G3_Workstation.html

Now, it's all very well to criticize any of these benchmarks/tests as biased, but do you have any real data to contradict them?

>And guess what? The tests Apple did actually represent what iMac users
>would typically do with their computers! And the applications and
>benchmarks they chose were NOT biased toward the Mac!

LOL! You think that people with iMacs will not be using MS Office or Photoshop, but they will be using Director? You also think that Apple's tests are not biased in favor of Apple? Really????

>So who would you consider more honest? Apple or PC World.
>
>Answer: Apple.

Correct Answer: PC World.

>The loser in honesty?
>
>PC World.

Correct Answer: You.

****

The iMac may be a good choice for some people. However, trying to make a case for the iMac based on performance is a waste of time IMO.

-Steve

The only thing certain about the future is that it hasn't happened yet.

I wouldn't worry about optimizing anything. Just get it to work. I
coulnd't even view anything... I had to edit your page in netscape to
be able to get to the videos directory.

Im using Netscape 4.5....
Good luck.

You could be right. I'm not sure of the exact history between the 86 and the
88, but it is as I happened to recall it (just like the fact that the 80386
was there first, then renamed i386DX and a subversion i386SX was
introduced).

here's an interesting missive from comp.sys.mac.advocacy -
complete with figures and web links - that puts paid to all of TIFKAS'
(The Idiot Forever Known As Sinclap) claims that the iMac is faster
than a 400-450mHZ Pentium II. In fact, you'll note that a CELERON
wipes the floor with an iMac in many circumstances....

TIFKAS has yet to post any hard evidence how Don Crabb came across his
final conclusion about the overpriced, underpowered iMac being able to
toast Pentium IIs - and I'm sure we never will, either. We WILL,
however, see more of his mindless posting of Apple and InCompUSA press
releases, and his insistence that PC magazines' results are of no
consequence because of their "vested interests" (personally, I think
it's more a three-piece suit).....

>after seeing that 2/3 of the tests were MS crippleware?

I see that Joe is still trying to make a pig fly ;-)

In the December, 1998 PC World test (p. 74-76) the iMac was faster
than the Celeron on only 1 out of 5 tests. Joe mistakenly believes
that it is valid to sum the results from this test. However, if you
apply that principal to other tests (as mistaken as that might be) all
of a sudden, it's no longer valid to do so. Joe is so biased and

partisan that he seems to have lost touch with reality.

For those of you that are interested in the *real* results from a number of tests with iMacs/233 Mhz G3s and PCs, I present the following:

November 1998 Maximum PC (page 100):
IBM Aptiva E3N vs. iMac):
300 Mhz K6-2 vs. 233 Mhz G3
Quake: K6-2 42% faster
Premiere: K6-2 81% faster
Photoshop image resize: K6-2 13% faster

****

As you can see, there is a large body of evidence that refutes Joe's lame assertion of *general* iMac speed superiority, let alone anything close to integer BYTEmark numbers. In fact, I haven't even presented the data comparing the iMac with 400 Mhz PII, where according to Mr. Jobs, the iMac is faster than the 400 Mhz PII (http://www.apple.com/pr/library/1998/aug/13fast.html)

-Steve

****
They said it couldn't be done,
but I grinned and went right to it.

I tackled the job that couldn't be done,
and by golly, I couldn't do it!

My 8 mhz ST will load and spell check a letter to my mother faster
than an i MAC and the fastest PII out there. It will check my e-mail
and send a letter faster than a 450mhz pII will load IE. My 8mhz ST
boots up in 5 seconds. I can boot my ST, connect to the internet,
write a letter, email it, and have a cup of coffee before the fastest
PII evens finishes the memory check. That's "real world" So in
conclusion, I will use my ST do my business and then beat you all to
that hot date with Cindy Crawford :')

B.P.

My Lynx and 2600 will load up a game faster than any computer out there..

But can your OS acomplish what the others have?

To bad the ST can't delete unwanted text that was not used as a reply..

Peter S.
Soon to be issued a PB G3/266 to replace PB3400!

Windows will do that automatically for you. Other systems call it a
"crash"

Not sure how stable a iMAC is. I would guess it's a lot more stable
than Windows.

Real world is what people use a computer for. Your average user
doesn't rotate and rescale 20 MB images. Nor does he/she render 3D
worlds to run around in. Your average user types letters/e-mail,
cruises the net, balances a checkbook, keeps a scheduler, and plays

games.

Technology in computers has reached a point where it far exceeds the needs of the average user. That's why sub $500 PC's are around the corner, and if you follow history on any consumer product, they will hit the magic $250 and less number.

Computers are also the only manmade phenomenon that do not concentrate on efficient use of resources. The power used to run a 400MHZ processor may be minimal, but multiply that by hundreds of millions and there is a lot of energy wasted. Highly optimized software can make a slower processor run faster than a faster processor with inefficient software.

there are - it's called MagiC. It's called N.AES/MiNT. It's called Linux. All three are wonderful, all three have true pre-emptive multitasking. Plus TOS itself is well-known for running rock-solid MIDI regarding timing. Try that with your iMac (oh, sorry, you can't - that's why Future Music magazine recently recommended their readers NOT to buy an iMac for making music, due to its lack of MIDI interface or any third-party support in the MIDI interface market, not to mention its USB being too slow for hard disk recording. Oh, and Steinberg hinted that if future Macs are going to be set up like the iMac, it may drop all Apple support altogether.....)

BTW, you COULD try running OS 8.5 in 10mB, but you won't get very much done (and it'll be slow to boot). And besides, why then does the iMac come with a minimum 32mB? BTW, according to a recent review of 8,5 in The Computer Paper (fine nationwide free computer tabloid in Canada) the reviewer mentions to get any real use out of it, you'd really have to have 64 meg installed. (He generally liked it, though).

If this is "progress", hand me my stone knives and bearskins (in the form of my Falcon and Powerbook 140)....

Cruising the net can require fairly good hardware if you are want the experience to be fast or you look at a lot of hardware intensive content (movies, java, VRML, etc.) Playing games can also be a hardware intensive task. My favorite game is Activision's remake of BattleZone. It requires a fast processor and 3D acceleration to look good.

It's hard to view computers as any other consumer item when they are so hard to use. A lot of consumers can't set the clocks on the VCRs or need to be shown how to put multiple disks in a CD changer (I had to explain how to do that yesterday). I think ease of use is more of a barrier than price.

> Computers are also the only manmade phenomenon that do not concentrate

> and there is a lot of energy wasted.

That's also true of others things e.g. light bulbs. What type of light bulbs do you have in your house? If you are using incandescent bulbs then you are using power unnecessarily and filling landfills. I could always leave my computer on and waste less energy than you are probably wasting on light. Same with transportation, heating, cooking, etc.

Of course.

Wait a second, there are reasons for using DejaNews as a newsreader aside from being unable to configure a "real newsreader":

- dejanews has excellent searching options
- dejanews doesn't force you to use the same computer all the time because you'd lose all your state information when you switched newsreaders
- dejanews is very fast at getting headers (because it can get them only as it needs them)

Without any real PMT or protected memory, it's likely
a competition based on who can f*ck up the quickest
likely ending in a draw.

>
>Real world is what people use a computer for. Your average user
>doesn't rotate and rescale 20 MB images. Nor does he/she render 3D

However, the average user is likely to use more than 4M
of RAM to futz with images these days. Technology has
advanced quite a bit since 1985 & the images are no longer
limited to a 32K framebuffer.

>worlds to run around in. Your average user types letters/e-mail,
>cruises the net, balances a checkbook, keeps a scheduler, and plays

```
>games.

     ...Doom is 5 years old already. Rendering 3D worlds in
     high resolution and high colordepth is actually quite
     commonplace these days.

>Technology in computers has reached a point where it far exceeds the
>needs of the average user.  That's why sub $500 PC's are around the
>corner, and if you follow history on any consumer product, they will
>hit the magic $250 and less number.

     While applications have hit a brick wall and are completely
     un-innovative for the most part, games are not. Also, more
     and more people are finally using the image manipulation and
     video capacities of their now overpowered machines.

     Consumers in 1999 are slowly moving towards the Amiga 2000
     level of functionality. Although, overpriced iMacs are still
     being targeted towards the more pedestrian 'Atari ST' level
     users.

Ah this takes me back, one of my favourite 8-bit games!

I haven't come across it on cartridge, or even heard of it being
available on cartridge.

Drop me an email with the subject being 'WANTED: M.U.L.E. On cartridge'
to asx@steverosie.demon.co.uk and I'll see if I can track it down
(that's if it was on cart.)

Yes 'Chunks' the iMac is selling well despite your asertion...

How has the Milan sold? How come its not available in the Twin Cities?

Apple's iMac Top Retail Seller In November
(12/22/98, 10:13 a.m. ET)
By Reuters

SAN FRANCISCO -- Apple's novel iMac computer was the top-selling PC in November at both U.S. computer retail stores and through mail order, according to PC Data, a market research company.

The iMac accounted for 7.1 percent of all unit sales and 8.2percent of total retail revenue in the United States in November.

Retail and mail order, however, presents about 15 percent to 20 percent of the total computer market worldwide, PC Data said.

PC Data, based in Reston, Va., said the iMac's rankings have steadily improved, moving up from fourth place in August to third in September and second in October.

This resulted in a doubling of Apple's overall market share, from 5 percent or below prior to August, to approximately 10 percent of the U.S. retail market, since the launch of the iMac in August.

In November, the iMac led, but was closely followed by sales of Compaq's

Presario 5150 with an Advanced Micro Devices K6- 2 processor and the Hewlett-Packard Pavilion 6355 with an Intel Celeron processor, which was the No. 1 PC less than $1,000 in November.

The average selling price of the iMac in November was $1,226, down slightly from its retail price of $1,299, which accounts for some price cutting or other product bundling by retailers. Some retailers are throwing in a printer or other peripherals with the purchase of an iMac.

Last week, Best Buy Computer, a computer retailer, said it had cut the price of the iMac to $1,099.

Stephen Baker, PC Data's senior hardware analyst, said he did not believe the iMac would continue to lead through the month of December, because of price competition from other PCs.

Peter S.

You also left out Be OS, Java and true linux...

There will be midi for the imac...With the large installed base there will be
midi in the comming months.

If Steinberg doesn't do it...their competitors will.

Why shouldn't the iMac come with 32MB?.I wish it came with 64MB.... 8.5 does
more than TOS period...Can TOS use fast G3 processors?

MIDI over a polled 12M(BITS)/s bus. I can just see the
Steinbergs just salivating at that prospect.

>
>If Steinberg doesn't do it...their competitors will.

It's more likely that their competitors will
discover a kernel that they can tweak to their
liking (like ST or Falcon MIDI hardware) &
can run on Falcons, Amigas, Alphas, Macs or
even cutrate PC's.

BEOS? You have to be kidding - Apple isn't even giving Be any
licensing or programming info.

Java - dead out the gate, overhyped.....

PPC Linux? oh, yes, available RSN - we've had Linux available for
the last three years. Playing catchup again.....
>
>There will be midi for the imac...With the large installed base there will be
>midi in the comming months.

why not now? Musicians want this hot technology NOW, not RSN .and
with Apple's well-known non-support of the MIDI community regarding
standards...

And USB is STILL too slow to do hard-disk recording.

>
>If Steinberg doesn't do it...their competitors will.

If Steinberg doesn't do it... their competitors may well ask why, and emulate them, if Apple doesn't get their collective butts in gear....

TOS can do everything thrown at it, as attested to many satisfied Atari users, as well as Hades and Milan users - and without the crutch of a bloated operating system like OS 8.5. With your well-known non-authoritative "opinions" on TOS, which you've used a grand total of ONCE, we know that your arguments fall flatter than a souffle....

..Can TOS use fast G3 processors?

If programmed properly, yes. The new "Tempest" upgrade board for the Falcon was originally going to use a G3, but now they've leapfrogged over that to Motorola's new "Coldfire" chip.....

yes, an old saying - which really should have been buried and put out of its misery years ago. You know it not to be true, of course, but choose to stick your fingers in your ears - an amazing feat, considering you also do so with your foot in your mouth AND your head "up there....."

There is nothing to stop TOS from using G3 processors. Rumor has it that the new Tempest accelerator for the Falcon might be using PowerPC chips.

Happy? (I doubt it)

->> If this is "progress", hand me my stone knives and bearskins (in
->> the form of my Falcon and Powerbook 140)....

Kinda like the sealed up design of the iMac, eh? ;-))))

->Like my old saying..."Who needs modern hardware, OS and apps?....thats why I
->love the ST!!"...

Got a modern OS...Mint/N.aes/Thing. Does pre-emptive multitasking, for example. How long did it take your precious Mac's to get that? (or does it even have it yet?) Hmm...?

Got oodles of modern apps, too...and they don't require rocket scientists to learn, gobble boo-koo amounts of Ram, or have to have bloated OS's to run... ;-)

Later versions Linux 2.1.x can handle USB with keyboard and mouse so
far.

Chunks please use a larger bib to wipe up the extra chunky risidue that is
proving difficult clean up...
Please get it done...What do you not understand?

Media Advisory

Colin Crawford Affirms Intergraph Computer Systems Participation at Macworld
'99 San Francisco

HUNTSVILLE, AL, Jan. 11,1999 � Colin Crawford, President / CEO Macworld Magazine, officially stated today that rumors of Intergraph Computer Systems being 'kicked-out' of Macworld Expo. were completely untrue.

"Intergraph Computer Systems' (booth #1817), was a welcomed exhibitor and participated in the Macworld Expo, January 5-8, 1999. Their exhibit was in complete compliance with the IDG/Macworld Expo show guidelines," stated Crawford. "Intergraph Computer Systems, IDG Show Management, and myself have always worked well together to deliver access to the latest computing technology which complements the Macintosh user's experience. We look forward to working together in the future."

Crawford added, "Intergraph has been a friend to Macworld and has done an above-board, professional job of presenting its MacFriendly NT solutions to this audience. I have a great deal of respect for their organization and the efforts they have made to support the Mac environment."

"This is the third Macworld for Intergraph Computer Systems and a good forum for demonstrating our MacFriendly(TM) solutions. Our team grew up in the Mac culture and are very familiar and sensitive to the issues Mac users face," said Bruce Sholes, executive director, Intergraph Computer Systems, Publishing and Prepress Division. "We focus on the integration of our NT systems and the Mac in one environment. Hence, our message has always been and still is integration, not migration. We appreciate the support of Macworld and the IDG show organizers in facilitating our presence in Macworld publications and events. "

Intergraph featured its MacFriendly solutions, including workstations and servers, for seamless Mac and NT connectivity at Macworld and demonstrated Macintosh-based systems networked to Intergraph's Windows NT-based InterServe(R) servers in a series of hands-on workshops. Intergraph's MacFriendly TDZ(R) 2000 ViZual Workstations were featured in a number of third party vendor booths throughout the exhibit floor including Miramar, MetaCreations, Canto, Macromedia, Digital Studio (art gallery), and Media4.

well, just to spoil TIFKAS' mindless postings of Apple press releases, here's Apple's quarterly earnings for first quarter, complete with figures for you all to chew on.

For the most part they did pretty good. However, you may also want to check out the US Securities commission report (http://www.sec.gov) to see the stuff mentioned as Apple's concerns as well, which balances out nicely. Apparently Apple has been taking a significant decline in one of their niche markets, education - they also admit in the report that while profits are up, the actual number of computers they sold last fiscal year declined over the previous one. Of course, this is mostly at the beginning part of iMac sales....

Subject: Apple Press Release--99/01/13 Apple Reports Fiscal First Quarter Profit of $152 Million

Good Day:

The following press release crossed over PR Newswire on Wedneday, January 13, 1999 at 1:30 p.m. PST. Thank you.

For Immediate Release

Apple Reports Fiscal First Quarter Profit of $152 Million

49 percent unit growth outpaces industry average

CUPERTINO, California<Jan. 13, 1999-<Apple Computer, Inc. today announced financial results for its fiscal 1999 first quarter which ended Dec. 26, 1998. For the quarter, the Company posted a net profit of $152 million, or $.95 per diluted share. These results compare to a net profit of $47 million, or $.33 per diluted share, achieved in the year-ago quarter. Revenues for the quarter were $1.7 billion, up eight percent from the year-ago quarter, and gross margins were 28.2 percent, up from 22.4 percent in the prior year. International sales accounted for 47 percent of the quarter's revenues.

The current quarter's results included a $29 million after-tax gain from the sale of 2.9 million shares of ARM Holdings plc. Without this non-recurring item, the Company's net income for the quarter would have been $123 million, or $.78 per diluted share.

Sales of 519,000 iMac (tm) computers in the quarter drove overall unit growth to 49 percent year-over-year. Ending inventory dropped to $25 million, which represents two days of inventory.

"Unit growth year-over-year was three to four times higher than the industry average," said Steve Jobs, Apple's interim CEO. "In addition, Apple ended the quarter with only two days of inventory, besting industry-leading Dell's seven days of inventory."

"Growing earnings combined with world-class asset management resulted in positive cash flow from operations of $223 million," said Fred Anderson, Apple's CFO. "Apple now has nearly $2.6 billion in cash and short-term investments."

Except for the historical information contained herein, the statements in this press release are forward-looking statements that involve risks and uncertainties. Potential risks and uncertainties include, without limitation, continued competitive pressures in the marketplace; the effect competitive and economic factors and the

Company's reaction to them may have on consumer and business buying decisions with respect to the Company's products; the ability of the Company to make timely delivery of new products and successful technological innovations to the marketplace; and the ability of the Company to successfully evolve its operating system. More information on potential factors that could affect the Company's financial results is included in the Company's public reports filed with the SEC, including the Company's Form 10-K for the 1998 fiscal year, and the Company's Form 10-Q for the quarter ended December 26, 1998, to be filed with the SEC.

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission<to bring the best personal computing products and support to students, educators, designers, scientists, engineers, businesspersons and consumers in over 140 countries around the world.

Not yet, a G3 upgrade card is in development as well as a 3DFX Voodoo card.
An 060 Amiga can get to performance levels of a low end PPC MAC.
AmigaQuake is a good example of this.

AmigaOS is just as fast as a G3/400 MAC but in sheer number crunching
performance a G3/400 would obviously be a lot faster.

Quickpak???. Sheez, your news is as old as the PC architecture :-)
Gateway own Amiga Inc and Phase 5 and Haage and Partner (and a host of
others) are continuing Amiga hardware development.

> > Not to mention the fact that the 060 continues to be developed further,

>
> What user demand?

Embedded systems. Demand outstrips supply.

Regards,

Clockmeister.

>100% of ALL Playstation titles. Now what is the better value?
>

   Oh my, you surely are misinformed! The emulator costs $49. That's the
price it went for in Macworld.
   Well, I don't know about you, but I love being able to play Playstation
```

games on my G3. Games run flawlessly. I only wish I had a PowerBook, so I could play PSX games anywhere, something you CAN'T do with your "genuine" Sony item.

> 2) in order to use the Playstation emulator, you must obtain a GENUINE PLAYSTATION OS ROM DUMPED TO DISK. The only legal way you can do this is if you actually OWN a Sony Playstation (again, $90-129 US - KA-CHING!). Do the math - is it better to just pay $90-129 US for a genuine Playstation that is 100% compatible with all games, or to spend $180-219 US to run a not-100%-compatible emulator on an iMac?
>

Again, pure bullshit. It doesn't need any sort of ROM. All the emulator is is a 900kb executable. No ROMs, no BIOS, no nothing. The PSX emulators for Windoze require the ROM file, though, so get your facts straight.

> 2a) those of the emulator's users who would forego #2 and actually PIRATE the ROM will soon discover just how much a sense of humour Sony's army of patent lawyers lacks (and last time I looked, software piracy/breach of copyright carries stiff fines, stiffer prison sentences, and potential lawsuits from the patent owners). Is it really worth it?
>

News today say that Sony has abandoned the idea of suing Connectix, based on their evaluation of VGS. It seems it's a completely reverse engineered product, and doesn't use a single copyrighted Sony technology. And since your point #2 is completely false, there's nothing holding you, at least from a legal point of view, from running Playstation games on your Mac G3.

> As usual, TIFKAS is a penny short, a pound foolish, and (like many Mac game titles) a year late!
>

No, you're the wrong fool here. Get your facts straight, because you're now looking just as bad as TIFKAS.

Wow, you sure cross-posted a lot of newsgroups, but you missed comp.os.be.advocacy. Your gripes are old hat to us unixers, but people should know about BeOS, too, since unix/linux/freebsd aren't for everyone.

Heck, I agreed to that long before I heard of this newsgroup!

          ^^^^^^

    I suggest that you read your missive again - if you'll notice, that
was a categorical denial by Crawford that Intergraph was kicked out.

    Unfortunately, it all rests on TechWeb - the organization that
first reported the incident. If you'll notice, they quote Crawford on
why Intergraph was being kicked out. And, if you'll also notice,
TechWeb has yet to retract the story as it was reported.
```

In any case, you seem to misconstrue the difference between a categorical denial by a participant and a retraction by the news source, who seems to be holding to the story. In which case, until TechWeb retracts the story, you have no case.

So go ahead and ROTFLMAO - because the more you do, the more your head will be further wedged "up there"......

BTW, it's spelled "admit". Hopefully InCompUSA will pay for your remedial spelling course......

->S-VHS for editing on my Falcon and Expose.
->
->Mike
->
->(I thought the Robot sucked, but the virtual interface was cool as

->was the rest of the hardware on the show).

I have to admit, when I took my 8 yr old to see it, I figured I'd
sleep through it, but I was pleasantly surprised as well. Special
effects were solid, storyline was fair, the lines were delivered
well (believable) (and did you notice the "romance" between Don
and Judy? It was there, but she handled his advances with aplomb,
i.e., no gratuitous sex scenes) Well done. I also like it when they
give me a "villain" I can hate. ;-)

That VI rocked! (and of course, like so many-that robots voice is
-embedded- in my psyche!) I thought the pace was high too (and
that is always a good thing). My fav scene? From the moment they
burst out of hyperspace (was that well-timed silence or what?)
all the way through the spider battle. ;-)

Early 2000 will see the release of the brand new Amiga II so current
upgrades are just there to keep current users up to date. (as much as
possible for a small market)

>

You're right. What I meant is that AmigaOS is much faster then MacOS,
partly due to PMT (which the Mac still hasn't got) and a high level of
efficiency (not bloated). This means desktop functions are of similar speed
on an 060 Amiga and any Mac.
A G3/400 Mac wins out in numbercrunching performance.

Does that make sense?.

Deliver what?. Watch out for a brand new Amiga early next year. Developer
systems are nearing completion and should be released shortly.

But demand is demand all the same. The 060 is a good, efficient processor.
Hence it's popularity. It's also much easier to implement then the G3
processors.

Regards,

Clockmeister.

I don't remember the actors name that played Smith, but he was a very
easily disliked:). I know he has played a few psyco cops in other
movies and always does a good job. The ships and harware are
outstanding. They kept the special effects to a minimum (as much as
you can with that type of movie). The movie rolled right along, almost
too fast. Maybe a sequel:).

Which was most of the flick:).
They had to go out of the way to add some "hokieness" to it to follow
along with the series. Oh, the pain, the pain:).

Delivered with the standard Sinclair three-dotted sortie.
You are stuck with the common PC disease of just looking at numbers instead of
actual, real-life performance.

It's the same CPU, Peter.

Like WHAT? Be more specific. Still using Deja-News ehhh...
And WHICH OS for the Atari are you refering to? There are a lot of different ones in use by many Atarians.

Clockmeister wrote in message <01be3d8a$d87e7560$5a5e0fcb@default>...
>What soundchip does the 1040STfm use?
>More importantly, why is the sound output more like that of a C64 then an
>Amiga?.

Because the STfm is just an ST with a (F)loppy disk drive and a TV (M)odulator built-in. The sound chip used is the same used in your basic MSX-1 computer, the Yamaha YM-2149 which was at one time a pretty popular soundchip, although originally some Texas Instruments chip was to be used.

Like the MSX however, for musical purposes all Atari 16-bit and 32-bit computers have standard MIDI ports, and for a long time, were the only computers to come standard with it, hence the success of Cubase and Notator / Logic.

If you want to hear decent MODs on an Atari, you will either need a soundcard / DAC, or an STE / TT (both 50kHz dual-channel 8-bit stereo DMA) or Falcon (16-bit stereo DMA, 50kHz, 8 channels).

There is more to this. I've always seen the ST as the successor to the C64 in technical aspects, and the Amiga as the successor to the Atari 8-bit computers. This is reflected in many ways, including audio and video. Just look at the 320x200 screen reolution and such. It is even reflected in its founding fathers, the one of the Amiga and the Atari 8-bit being Jay Miner and the one of the C64 and the ST being Jack Tramiel. Indeed, an Atari 8-bit computer has MUCH better and richer (four-channel: compare to Amiga - as opposed to three channel: compare to ST and C64) sound, if you only consider its built-in audio capabilities. The 8-bit 1450 XLD however, had even more interesting features, even on things concerning audio. Info can be found on Atari Historical Society (URL coming up next paragraph)

In fact, there was an official license agreement for Atari to produce Amiga computers as an extension to their Atari 8-bit XL line of computers and they even made a prototype with a XL name but an Amiga architecture. This can be verified on Curt Vendel's excellent Atari Historical Society website, www.atari.nu / www.atari-history.com

The introduction of the STE cought up with the Amiga in both sound and

graphics areas, and again there was some sort of mingling of employees. The
Lynx, as you might know, was developed by Amiga developers, originally for
Epyx, who got into financial problems. This lead to a takeover by Atari
Corp. The original developerskit for the Lynx consists of a Commodore Amiga
with a Howard board, which is what Atari delivered until withdraw from the
hardware-market (they're currently owned for their name by Hasbro, who are
republishing classic games like Centipede in 3D for the PC).

Perhaps you should connect a synth to your ST and play an old Sierra
animated adventure...
There were however all sorts of soundcards for the ST, including 12- and
16-bit samplers and also, in stereo.
But what you really should have acquired was a Mega STE or a 1040 STE. You
could then even have upgraded it with standard SIMMS.

>
>I was going to use it as a MOD player but that seems pointless.

Use it as a MIDI system instead. It's not pointless if you use it with
appropriate hardware add-ons, although those may be hard to come by these
days.

YM-2149 comparable to TI something. PCM came with the STE's (50kHz 8-bit
stereo DMA).

Come to think of it.... the STE had line-level RCA / cinch outputs, I was
disappointed that Atari reverted to the mini-jack solutions seen on so many
PC's. But then, they marketed the machine as a consumer machine and fired
the whole German staff who focussed more on the professional market. Then
they focussed on the 64-bit Jaguar system including voicemodems, VR-helmets,
CD add-ons networking and so on, in 1993. Ofcourse, being great marketeers,
they couldn't live up to Sony's marketing standards or Nintendo's cash....

Depends on what field of music production you're in. Dance is probably
better done on the Amiga because of adding computer audio and such. BUT -
just take a look at the charts of the 80's, and guess how many productions
of those were made on an Atari, using Cubase or Notator (later transformed
into Logic)...

Back then, these applications were only available for the Atari and scarcely
for a Mac (American market). Most music productions were done on the Atari,
incl. such names as Michael Jackson and Madonna, to name but two.

So Atari excelled in the sequencing department, and Amiga excelled in the
video department... what a team!

Regards,

Clockmeister.

Falcon's are rare here, so that really isn't an option. The reason I asked
the original question in the first place is that I aquired this Atari for
free and I needed to put it to work (to justify it sitting around). No
offense, but if I was to purchase a soundcard it would be for the Amiga as
it's my main toy.

From what I have discovered, Atari wanted to use some of the custom chips
technology, not use the whole Amiga architecture. In essence though, it
amounts pretty much to the same thing.

> The introduction of the STE cought up with the Amiga in both sound and

Too little, too late I think. The Amiga already had the video production
market by the balls by then.

The

The Lynx was an excellent product and I can't understand how it failed
(largely). BTW, I wasn't aware of the Amiga connection :-)

Newsgroups: comp.sys.atari.advocacy
```

Well, well, well. Just a few weeks ago, in dissing the viability of modern TOS systems like the Hades and the Milan, TiFKAS (The iDiot Forever Known As Sinclap) boasted about how modern operating systems like the BeOS proved how cutting-edge the Macintosh was. Indeed, I was called on the carpet by another Mac user for even daring to suggest from info that I had heard on comp.sys.mac.advocacy that Be was not giving as much support to the Mac as they were to the PC platform as far as keeping up with the up-to-date hardware in both camps.

Well, looky here! Here's some info from Be themselves, on why they are having problems keeping up with the cutting-edge G3 found in such computers like the now-less-but-still-overpriced, now-less-but-still-underpowered iMac, as well as the new 400mHZ G3 server systems. A problem which is being precipated by Apple themselves, who seem afraid of the thought of having an operating system not produced by them show up how bloated and "old-hat" the MacOS has become. OTOH, the PC version of BeOS (which looks pretty nifty and powerful) can run on all the current modern PC architecture out there......

Perhaps TiFKAS can explain to us how "cutting-edge" an alternate Mac operating system can be when it can't even run on anything but year-and-a-half-old hardware (which, using TiFKAS' own yardstick for older but still usable hardware, makes it "junk" and not worthy of your attention). My guess is that instead he'll try a number of his old tactics:

1) deny, deny, deny (just like his hero Bill Clinton - and like Bill, be doing so when obviously caught with his pants down?)

2) try to dodge the subject by mindlessly posting an Apple press release - which, BTW, he has shown on several occasions that he has never read in full.

3) boast about the money he's making, and what a "macho stud" he is (which, BTW, is a sign of a true Internet "kook" with way too much time on his hands).

4) try to lash out against his imaginary friend "Chunks", who doesn't exist and has never existed on this or any forum, or his other favorite target, the equally imaginary "Atari Jihads" who are "out to get him", with his usual extreme bad grammar and unacceptable spelling mistakes (Is "Chunks" anything like Elwood P. Dowd's friend Harvey, the six-foot invisible rabbit?)

5) skip town with his tail between his legs and not show back up for another three weeks?

If anything, this should make for a very lively debate here - and which usually ends the same way, with TiFKAS protesting being spoon fed his much-hated strained spinach by his long-suffering Mummy (Atari and TOS users, and many intelligent Mac users, indeed, many PC and Amiga users as well, OTOH, have always eaten their spinach and drunk their milk to their Mummys' satisfaction, and have grown up to be big and strong and intelligent)

(BTW, TiFKAS, you may now notice how I now spell the abbreviation of your given name - it reflects the fact that you're so enamoured of your beloved iMac that you practically wet your pants when the new colours were announced. The "i" stands for "ignorance".)

Does the BeOS run on Apple's new "G3" Power Macs, which use the PowerPC 750 (or "G3") processor?

No, the BeOS is not compatible with Apple's "G3" systems. We have requested from Apple the detailed technical specifications we would need to provide support for these systems, and Apple has declined our requests.

This information, concerning the design of the logicboard (including information about address spaces, custom logic chips, etc.), is available only from Apple. It is available only under non-disclosure, and only to "Mac OS licensees."

The necessary information is much more detailed than the "technical specs" information Apple puts on their web site. Trust us, we haven't "missed" something tucked in some corner of their site. Apple does not make this information public at all anymore, because there are no more Mac OS licensees.

Without this detailed technical information, it is impossible for us to support new Power Macintosh hardware from Apple.

Can't you reverse engineer the information you need to run on Apple's "G3" machines, maybe from LinuxPPC, which runs on such systems?

No. Partly it's because we're nervous about porting to a platform who's owner doesn't want to share technical information. Sure, we could figure it out, with help from Linux source, but that's a tricky way to build a commercial, stable platform, and we'd always be at the mercy of undocumented, unnanounced changes to the hardware.

Even if we did want to take this approach, this would take a lot of resources, and we're stretched to the max as it is.

There's also two legal issues, one, would Apple let us do this (who cares if legally it's OK, they have a lot more lawyers than we do), and two, could we use the Linux sources and still keep the BeOS proprietary (which we intend to do, see the FAQ on that).

Does this mean that Be is abandoning the PowerPC/Power Mac platform?

Not at all! Be fully intends to continue supporting existing BeOS Ready Systems for as long as possible, and we will add support for new systems where that is technically and economically feasible.

It should refute your earlier claim that iMacs were not selling well.

Peter S.
20 days till Cupertino for a week of meetings..

> Where can I get it or at least screenshots?

There is a mailing list for MiNT as well as many MiNT sites out there.... do a search on the many search engines for something like Mint and Atari.

hmmm, even with how well iMac sales did in the beginning, overall sales of computers at Apple were down - let's look at the big picture there. It's all there in the SEC report.

BTW, according to another report, even with 800,000 iMacs sold worldwide, the PC industry in contrast sold 40,000,000 PCs during the same time frame. Certainly puts a dent in your wild claims of "10% marketshare".....

Well I alwas was a profound proponent of Atari and Amiga cooperation, but nobody seemed to share my passion and vision. I believed that it was a necessity for both companies to hold their grip on the market, and survive. The one way they could produce truly AWESOME advances and stand ground against the other platforms with a larger overall market share.... although from marketing point of view it would have mattered that much I guess...

>
> *Except in the case of Apple, who are still trailing. PMT Mr Sinclap?...

grin :-) I never even saw Apple as an "enemy" but rather one of the Motorola gang, one of the "A-Team" (Atari/Amiga/Acorn/Apple), and Mr. S.'s attitude and postings in this newsgroups will not affect my opinion in any direction, although it does confirm the feeling you sometimes get in discussions with people who claim to be die-hard fans for the platform. I hope it doesn't count for ALL of it's fans. On the other hand... Apple's

```
been "sleeping with the enemy" lately, hasn't it?

Any comments on this?

You're pathetic.
If you'd do your homework, you'd know for a fact that Atari is now owned by
Hasbro, which is hardly out of business. As for the computer side of
things.. I think there's more to choose from in the Atari and Amiga clone
market than the extensive range of computers that Apple currently has to
offer or can supply...

```

Did you visit www.atari.nu? It shows a detailed contract in writing,
mentioning in detail, the WHOLE ARCHITECTURE specification.

Well, all I know is that Amiga Technologies existed before it was taken over
by Commodore and it was after this takeover that contracts between Atari and
Amiga Technologies (or Commodore by his time) were breached. Atari even
supplied a major quantity of technological knowledge and engineering
manpower to Amiga Technologies before the takeover, most of which remained
working at Commodore because of "their man" Jay Miner. Likewise, the
Tramiels took over Atari and brought their share of engineers. So your Amiga
has in fact, to some extend, quite a lot of "Atari blood" so to say ;-)

The reason of the takeover by Commodore is believed to be its vision of a
necessity of a 16-bit and 32-bit computing platform.

>market by the balls by then.
The STE was not meant for video production, that would be more the TT or
Falcon (which has a universally programmable DSP) area, although the latter
more excels at audio recording. The STE was just meant for games, but yes,
it was way too little and way to late. I still feel sorry having my STE
traded in for a Falcon though. I should have kept it and simply added a
Falcon. I later acquired an STfm machine but sadly it isn't quite the
same... :-) I miss that 50kHz stereo DMA sound of some dedicated STE
software...

>The Lynx was an excellent product and I can't understand how it failed
>(largely). BTW, I wasn't aware of the Amiga connection :-)
I do: it was marketed by the same people who excel in technology, but really
shouldn't become salespeople.... poor marketeers. Both Atari and Commodore
seemed to suffer from this. I always wondered what a merger between Atari

and Commodore would have been. Like: selling games machines under the Atari
label because this is practical because of its name (which would include the
Commodore CD32 and CDTV), and selling computers under the commodore label,
or perhaps an enitrely new brand name).

The Jaguar (64-bit) and the Falcon were also excellent products, as were the
portfolio, the transputer workstation and the TT and Mega STE. The rest of
the 16- and 32-bit systems were arguably "lesser" systems who had their own
succesful niche market , but with good reason. They obviously had their own
appealing qualities that can not just be accounted for by counting die-hard
Atari fans. At least they were highly affordable at launch time.

>
>My previous comments probably cover this.
Just give it a try once. The sound of the STfm is not great but a Sierra
game that supports a synth on your MIDI-port sounds pretty great - well the
music part at least so long as it has support for your synth (by this time,
the "General MIDI" specification did not exist yet)...
>
>> >I was going to use it as a MOD player but that seems pointless.

MOD is originally a native Amiga format. So I was wondering why you would
use an ST for it while you have an Amiga :-)

>>
>> Use it as a MIDI system instead. It's not pointless if you use it with
>> appropriate hardware add-ons, although those may be hard to come by these

>>
>Especially in Australia.

Can't judge about that. I'm sure though someone might have some old version
of Cubase or Notator lying around and surely someone has a synth or module
somewhere? :-)

Perhaps you ARE misinterpreting. How about Atari clones 1.5 years old? You
did mention those once or twice. Looks to me like you're the one who is
"selectively overlooking" which is btw - NOT the same as misinterpreting.
Buy a dictionary.

Yeah, and you're advocating in the wrong newsgroup... this is
comp.sys.ATARI.advocacy
You're not even advocating. You're posting press releases. Hardly anything
intelligent and worthwile discussing in the context of a computing
platform's newsgroup? More for analysis by a linguistic newsgroup that would
also give you a detailed statistical analysis and perhaps even a diagnosis
for your communicative skills.

>years...
```

no misinterpret - you made your point quite clear. And what school administrators are you quoting? How about some names, dates, situations?

What they want - and what they are actually able to GET - are two different things. What I've read is that, due to the cutting of education budgets by governments, that schools just can't afford the cutting-edge stuff. I know of many organizations that collect old computers so that they can be used by students rather than showing up in landfills...

>
>
>>   1) deny, deny, deny (just like his hero Bill Clinton - and like
>> Bill, be doing so when obviously caught with his pants down?)
>
>His pants were down...so what!!!

he denied that his pants were down. If he had only told the truth when the scandal was first revealed, and apologized for it sincerely, instead of that self-serving speech he gave, he wouldn't be in the mess that he's in, and he'd certainly be better remembered in history as a great legislator.

>>   2) try to dodge the subject by mindlessly posting an Apple press
>> release - which, BTW, he has shown on several occasions that he has
>> never read in full.
>
>Did not you recently post an Apple press release?

I read all articles I post in full, and I make the appropriate comments and notes - I also usually include a link to the URL. On several occasions you mindlessly posted a number of press releases that it was clear that you didn't even read, and didn't even make the effort to format them properly......

>
>>   3) boast about the money he's making, and what a "macho stud" he is
>> (which, BTW, is a sign of a true Internet "kook" with way too much time
>> on his hands).
>>
>
>When did I boast...What I get paid is nothing to cry about. It's adequate
>with a pay raise..But nothing to boast about...Are you jealous? How much
>does your labor job pay?

ahhh, showing your true colours about the contempt you feel about labourers, which you previously denied you said when it came up the last time. Just remember that the labour class make up a significant part of the economy regarding their purchasing power - and they do purchase computers and peripherals. Which means that they help pay for your wages, pinhead. Want to try extricating your OTHER foot from your mouth?

BTW, I've been asked to go to an interview tomorrow regarding a job opportunity that may well mean a promotion and a better wage.....

you certainly have boasted about what a stud you are many times, as well as your bank account, which any search under DejaNews will reveal.....

>> 4) try to lash out against his imaginary friend "Chunks", who
>> doesn't exist and has never existed on this or any forum, or his other

>> strong and intelligent)
>
>You have way to much time...What happen? Did your employer cut your seasonal
>labor hours?

again, a slam about my being a labourer - shows that you're quite the elitist - and that I'm clearly getting under your skin.. I happen to budget my time quite nicely, thank you.

AND, I tend to go and talk under many USENET forums - unlike you, who seem to just hang around mostly in the Atari forums to slam people because you're so self-conscious that anyone is actually being productive with an Atari...still afraid to post to comp.sys.mac.advocacy?

>> (BTW, TiFKAS, you may now notice how I now spell the abbreviation
>> of your given name - it reflects the fact that you're so enamoured of
>> your beloved iMac that you practically wet your pants when the new
>> colours were announced. The "i" stands for "ignorance".)
>>

>I don't own an iMac...

but you certainly like boasting about the iMac, despite its many flaws....the fact that you keep harping about the new colours is a legit comment to make on your obsession, as well as your ignorance....

>
>>   Does the BeOS run on Apple's new "G3" Power Macs, which use the
>> PowerPC 750 (or "G3") processor?
>
>Unfortunately no..I wish Apple would give Be in what they need to make it so..
>MK Linux does..

now that is at least one of the first honest admissions you've made in a long time.....

>>
>Still a veep?

still a moron? Since when is it a shame to be the number 2 man, especially when the #1 man is also doing a good job? The TAF executive acts as a team, not like a Klingon Battle Cruiser crew.... :)

BTW, the interviewer was impressed by my being a "veep" on my resume that they were interested enough to consider me for the new post....

Like what?. To compare to what Mac app?.

When will there be a modern OS for the Mac?.

>
> Still clinging to hope that the Amiga will rise from the lava?

Nope, I enjoy using my Amiga now, and my PC to a lesser extent. If it
happens it happens, if not who cares. Apple is dead in the water if the new
OS doesn't live up to the hype. (Which it won't judging by Apples track
record)

Well, there was no iMac in my stocking this year.
Thank the powers that made me.

But, it wasn't for lack of being good.
Santa left (along with the new house, carpet, fridge, washer) two brand new 1999 Honda CRX 125 and 250 motocross machines. One for my loyal Falcon using son, and one for the diehard dad.

So, Sinplop, the bike shop got the nod over any new computer that Apple could manage to come up with. I guess for $10.5K, I could have purchased a few iMacs. But then again, I already have a nice fish bowl.

Merry Christmas and Happy New Year to all,

Mike

>Merry Christmas and Happy New Year to all,

There were no computers in mine this year, either. BUT, Santa gave me something I really needed - a new crock pot (one of my other hobbies is cooking, and you can make a great mushroom spaghetti sauce with these). And some things I also needed around the house, like socks, laundry detergent, toiletry items.

Now my mother got the really nice present - a Mac IIci . From ME. And now my brother and I are going to configure it nicely so she can use it for her business (BTW, I hit the jackpot with this one - according to Apple's web site, this puppy can be upgraded so it makes a nice cheap Internet box). No prejudice against these fine Apple computers, just against those few MacDavidians sorely in need of lives.

Let's hope that TIFKAS (The Idiot Forever Known As Sinclap) got what was coming to him this year - a clue, an attitude adjustment, and maybe some penicillin :)

Happy New Year to you all (including you, TIFKAS). Let's make 1999 the best year yet....

Perhaps you should send Santa My way.  Amazing how many ST users are into
motorcycles. My friend is the Canadian Superbike champion and just signed
on with Honda Canada. They gave him two CR250s to train on as well as 3 CBR
900s. They didn't give him any iMacs either? Hmm.

Gee, can I get a fish bowl too? I broke my collarbone racing last year
1997 and it won't heal properly. I am getting my race license again this
year, but I figure if this doesn't improve, I will be looking at fish for
some time to come.

Anyways, I am back on the computer again. I got the falcon in June but haven't
had a chance to use any of my computers.

if my mother was a computer novice, getting an ST would've made sense, BUT she's been using Macs for a number of years, mostly borrowed Macs from my brother. For her business she makes use of ClarisWorks. I just felt that it was time she actually owned a Mac outright. Now it's just a matter of getting together a monitor for it (Mike has a line on a few of them), then a weekend configuring everything nicely for her.

BTW, I got the IIci for $75, and managed to get a used mouse for $35 (a
really nice Kensington, which normally retails around $55-62).

Anyways, I have been to busy to come out

Umm, I wish I would have gotten a now slow cooker. I warmed up a roast
for New Years, but the slow cooker is a bit used. I ended up just
setting
the pot on the stove for about 5 hours. My son got a wok. He has been
getting into cooking the last year. Just like a teenager though. In just
a few years he will be gone and I will have to do it all myself again:).
I don't think the girlfriend will ever move in:). His cooking is
better:).

My mom finally returned her Mega STE to me. I could never get them
interested
in the internet (except when they visit here), and my dad always thought
he was going to break something. That is a really hard mindset to break
when
a person feels that way. He did like Vegas Poker however:). I told them
I
would try out my Quadra 900 on them. They w�n't know it's slow and has
all
the bells and whisles:).

    my take on cooking came about after years of not properly watching
my diet, it was discovered that I have food allergies that were causing
some problems with my health (I have major allergies to MSG and to fish
oil). It wasn't a matter of pining for stuff I couldn't have, but
making the best of what I could :) I'm lucky in that I live in a small
area of Toronto where there are numerous vegetable stands where I can
get fruits and vegetables dirt cheap. And, of course, finding recipes
to try out. I try to limit myself to smaller portions of meat too. As
well as crock-potting, I also wok, and I just invested in a nice
Samsung microwave.

my mother wound up loving the Internet the minute she first got her hands on it - at my brother's house on his Macs. In fact, it came in handy when we began setting up hers, we needed to set some jumpers on a VGA "dongle" box, but didn't have the manual for it - after doing a web search, we found the entire manual online!

well, MacWorld is supposed to be on this week in San Francisco, so I would imagine he'll be back loudly braying about marketshare this, new product that. And, of course, mindless press releases.

I look forward to the debunkings :)

What a cheapscape. It's like giving a throw away nine year old ripped to
shreds library book..

I know how that is...Having relatives with the 30's great depression
mentality..

If you loved your mother you should of gotten her an iMac....now in five
flavors..no pink yet...-)...

He he he...I have been busy for the last two weeks and already missed.
From
the looks of the number of posts, time for sinclap to come back..

While sinclap was relaxing last week in southern california in front of the tube...a commercial from Mike Harris, the pm or guv! Hey my guv can beat up your pm...--)He was begging the u.s. states to invest in his ontario..he claims that taxes are low, an educated work force and an anti union province...what a load of crock...i don't get it....the elected gov intelectuals want to curb u.s. tv programming due to mythical cultural imperialism..how would it look when our managers demand you adopt u.s. standard work practises? what a bunch of crap...

Peter S.

Of course the jihads will be in denial and still claim that the hades and milan hardware is still superior even with the new speed bump iMacs with the lower price and five new colors. The best selling original iMac is still a bargain with a price cut to $1049.

Apple Announces New iMacs - in Five New Colors; The Most Popular Computer in America Gets Even Better for 1999

SAN FRANCISCO, MacWorld Expo, Jan. 5 /PRNewswire/ -- Apple Computer, Inc. (Nasdaq: AAPL - news) today announced a new line-up of iMacs� for 1999 featuring five stunning new colors -- Strawberry, Lime, Blueberry, Tangerine and Grape. The new iMacs also feature a faster 266 MHz PowerPC G3 processor, a 6GB hard drive and a new lower price of U.S. $1,199.

iMac has become the best-selling computer in America by addressing real consumer needs not met by traditional PCs, with its simple ten-minute set-up and Internet access, and its space and cable-saving design. With their striking new colors -- Strawberry, Lime, Blueberry, Tangerine and Grape -- the new iMacs will again change the rules of consumer computing by letting consumers select something they can choose in almost every other consumer product -- their favorite color.

``'What's your favorite color?' is going to become one of the most important questions for consumer PC buyers,'' said Steve Jobs, Apple's interim CEO. ``For most consumers, color is much more important than the megahertz, gigabytes and other gibberish associated with buying a typical PC.''

In its five new colors, iMac is the complete Internet-age computer right out of the box and features:

- A speedy PowerPC G3 microprocessor running at 266MHz with a high speed 512k backside L2 memory cache;
- Built-in 15-inch high quality display with 1024 x 768 resolution, 13.8-inch diagonal viewable image size;
- The world's easiest to use operating system, Mac� OS 8.5, which runs thousands of Macintosh� software titles;
- 32MB SDRAM (now expandable to 256MB);
- RAGE Pro Turbo Graphic controller and 6MB SGRAM;
- 6GB IDE hard disk drive;
- 24x CD-ROM drive;
- 10/100BASE-T Ethernet;
- 56Kbps modem (supports V.90 and K56flex);
- Two 12Mbps Universal Serial Bus (USB) ports;
- Built-in stereo speakers with SRS sound;
- Apple USB Keyboard and Apple USB Mouse.

Pricing and Availability

The new iMacs will be available via The Apple Store (www.apple.com) and through Apple Authorized Resellers within the next two weeks for an estimated retail price of U.S. $1,199. The original bondi-blue iMac remains on sale for a limited time for an estimated retail price of U.S. $1,049.

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission -- to bring the best personal computing products and support to students, educators, designers, scientists, engineers, businesspersons and consumers in over 140 countries around the world.

Apple, the Apple logo, Mac and Macintosh are registered trademarks and iMac is a trademark of Apple Computer, Inc. Additional company and product names may be trademarks or registered trademarks of the individual companies and are respectfully acknowledged.

Of course the jihads will claim that fire wire, faster bus, gorgeaous case, the inclusion of ATI ridge 128 and lower price doesn't count because the milan and hades hardware is still superior and will be forever...

Apple Launches Reinvented Power Macintosh G3 Line

New Line Has Fastest PowerPC Processors, Lightning Fast 3D Graphics
and Aggressive Prices

SAN FRANCISCO, MacWorld Expo, Jan. 5 /PRNewswire/ -- Apple Computer, Inc. (Nasdaq: AAPL - news) today introduced a completely new line of its highly-successful Power Macintosh� G3 computers, which feature new copper-based PowerPC processors running up to 400MHz and the industry's newest and fastest 2D-3D graphics accelerator chip -- the just released ATI RAGE 128. The new G3s also include industry-standard 10/100BASE-T Ethernet, USB and 400 Mbps Firewire -- all on the motherboard. Housed in a stunning translucent minitower enclosure with a revolutionary access mechanism that simplifies access and expansion, the new Power Macintosh G3 line starts at an aggressive suggested retail price (SRP) of U.S. $1,599.

``The original Power Macintosh G3 was a tough act to follow but we've done it with a new line that crushes the competition with its raw power, graphics performance and industrial design,'' said Steve Jobs, Apple's interim CEO. ``The new Power Macintosh G3 raises the bar on what people should expect a personal computer to offer.''

By combining a Power Macintosh G3 with one of Apple's new Studio Displays, customers can purchase the most complete Macintosh� system ever. The new Power Macintosh G3 line is perfect for design professionals who want to run the most powerful image-editing packages, home users looking for a machine that can handle the latest in graphics-intensive games and Internet applications, and educators who want a high-performance machine that is a solid investment for the future. With over 1,300 new software titles launched for Macintosh in the last eight months, the new Power Macintosh G3 line is designed to run the latest software at lightning speeds.

Key features of the new Power Macintosh G3 line include:

The fastest PowerPC G3 microprocessors yet -- running at 300MHz, 350MHz, and 400MHz, with support for up to 1 GB of DRAM in 4 DIMM slots ATI RAGE 128 graphics controller with 16MB SDRAM graphics memory and support for QuickDraw 3D RAVE and OpenGL -- making the latest games, graphics and video editing software stand out Translucent blue and ``ice'' minitower enclosure that provides the industry's easiest access to expansion slots and memory Two 400Mbps FireWire ports and two 12Mbps USB ports to connect the latest cameras, printers and storage devices; USB keyboard and mouse 100MHz system bus for fast data through-put Increased expansion options through three 64-bit 33MHz PCI slots; one 32- bit 66MHz PCI slot for graphics Fast networking through 10/100BASE-T Ethernet Storage choices including Ultra ATA-33 and Ultra2 SCSI LVD hard drives ADB to support customers' current displays and add-ons

Pricing and Availability

The new Power Macintosh G3s are available immediately via The Apple Store (www.apple.com) and Apple Authorized Resellers, with over ten thousand build-to-order (BTO) configurations, including industry-first options for DVD-RAM optical storage and soon to be available 100GB of disk storage and Gigabit Ethernet communications. The following standard configurations are also available worldwide through Apple resellers and The Apple Store:

Power Macintosh G3 - U.S. SRP $1,599 300MHz/64MB DRAM/512K level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/6GB Ultra ATA hard drive/24x-speed CD-ROM drive (maximum)/FireWire/USB/10-100BASE-T Ethernet Power Macintosh G3 - U.S. SRP $1,999 350MHz/64MB DRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/6GB Ultra ATA hard drive/DVD-Video/FireWire/USB/10-100BASE-T Ethernet Power Macintosh G3 - U.S. SRP $2,499 350MHz/128MB DRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/12GB Ultra ATA hard drive/24x-speed CD-ROM drive

BTO options are also available. Standard configurations include: Macintosh Server G3 - U.S. SRP $3,299 350MHz/128MB SDRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/9GB Ultra2 SCSI 7,200rpm hard drive/24x-speed CD-ROM drive maximum)/FireWire/USB/10-100BASE-T Ethernet Macintosh Server G3 - U.S. SRP $4,999 400MHz/256MB SDRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/2x9GB Ultra2 SCSI 10,000rpm hard drives/24x-speed CD-ROM drive
(maximum)/FireWire/USB/10-100BASE-T Ethernet

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission -- to bring the best personal computing products and support to students, educators, designers, scientists, engineers, businesspersons and consumers in over 140 countries around the world.

Well sportsfans...I see after two weeks from comp.sys.atari.advocacy the number of posts have declined dramatically. I am here to fix this...

Now lets see if Cab can with stand the test and load this site up..

Ummmm..... I'm pretty sure that CAB supports JPEG and there are even
decoders that use the Falcon's DSP. What exactly is your point, anyway? Oh,
I mean besides, you blind devotion to Apple?

Gee, maybe that should be Apple's new advertising slogan... "If you loved
your mother, you'd buy her an iMac." Either that or "Think Different, Crash
Often." :-) Just a harmless joke to those reasonable Mac fans out there. I'm
anxious for the PC clone makers to start knocking off the iMac.

    ironically, for once I actually AGREE with TIFKAS on this.

    Harris is an idiot, a liar, and a bully. He and his Regressive
Conservatives got in power making a number of tax cut promises, but
also said that they would keep their hands off education and health
care (in the latter, they said they would not "touch a single penny" on
health care). When they got into power, guess what they started slashing?

They responded to one public service strike by having a police force start busting heads. They created a crisis in the education sector by actually cancelling all teacher contracts. Their shutting down hospitals has lead to long lineups in emergency wards, and in the last week has led to two emergencies where patients were flown to other hospitals hundreds of miles away. They amalgamated the city of Toronto into one big megacity - against the city's wishes, even after a referendum held by the city soundly rejected any megacity plan!

Harris also is well known for putting his foot in his mouth - witness last year, when they cut supplement payments to welfare mothers on the grounds that "at least it won't be going to beer" - as well as being two-faced - telling an audience in New York that our education system "was one of the best in the world", and then later the same week telling the legislature that we had "the worst education system in the world".

The election is coming up this year, and even before the election has been called, the Harris machine has ALREADY started attack ads againts Dalton McGuinty, the leader of the Liberal party and the official opposition - I suspect that, knowing that their goose is cooked, the PCs have to make McGuinty the official Ontario boogeyman. What makes it worse is that they're using taxpayer's money to do it.

And speaking of taxpayer's money - the government recently shelled out money to pay for former legislature speaker Al MacLean's sexual harrassment suit - $750,000 CDN, to be exact. Part of this went to a private eye that MacLean hired to spy on the woman suing him, who was also found to be starting a disinformation campaign about the woman with her neighbors.

Harris is hinting that the campaign for his re-election will be "the year of the Middle Class" - but here, it'll go down as "the revenge of the working class". Not ONE person I talk to at work, on the street, or in TAF, has a kind word to say about Harris, the PCs, or their policies.

Now that I've got that off my chest, back to talkin' bout computers. Guess we'll find out at MacWorld about the announcement that will make the iMac less overpriced and less underpowered.....

Harris is the Premier of Ontario. Our Prime Minister is the Right
Honourable Jean Chretien, who is noted for being a tough guy who don't
take no B.S. from nobody.

Your gov. may be tough, but he'll have to get past the pepper spray
first :)

Atari used to put out a magazine called Atari Age from the Atari club back
from 1982-1984. These things have become collector's items these days and
are loads of fun to look into. There is a set of ten of them being sold
right now at eBay which includes the whole first volume. Best of all the
bidding starts for $1. Check it out at the following URL:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=54423349

A message from the other side of the world (civilized part)

Mr Sinclair bragged about:
>iMacs with five new colors.

Sinclair, I've bought a TT eight years ago, and it has some features wich the ImAc doesn't have......

1. reliable (where will the ImaC be in 5 years?? , recycled into a naturefriendly PCB-free COLORED toiletpot)

2. tested and proven technology (throw the Imac in a river and see what happens, now take a Atari and throw it in the same river; have you noticed the difference ?? You didn't ? don't worry in next weeks posting I'll tell you. In the meanwhile a G3 threehunderd and a bit Mhz should be just about able to solve the question in a week time, that's if it doesn't overheat of course.

3. A.A.C.S.S ==> Atari Automatic Color Shifting System wich is patented worldwide. I gues in a couple of days the lawyers of HASBRO will file a suit against APPLE wich will put them out of business once and for all.....
Unless uncle Bill G. steps in once again and saves them

You never heard of A.A.C.S.S ?? well let me tell you:

When I bought the TT it was housed in a white case, after a

couple of years it gradually shifted to creamy white, two years
later the creamy white turned into a nice dark creamy vanilla,
at the moment it has a nice light brown tobacco color, wich matches
the colorof my pipe almost perfect. Perhaps next month it will turn
to blue (grape) or yellow (lime) who can tell.
AACSS => constantly changing colors, covering the complete spectrum.

Signing of ... for now

atasoft@atari-computer.com (Belgium)

"There's always room for one more said the director of the
loony asylum"

PS 1: A couple of years ago Apple bought 10,000,000 sunglasses for
a big publicity-stunt in North-Europe. Nobody wanted them because
it always rains down there. So Steve Jobs once again got a brilliant
idea let's melt the whole lot and turn them into iMac-cases.
>the new iMacs will again change the rules of consumer computing by >letting
consumers select something they can choose
RECYCLED NATUREFRIENDLY SUNGLASSES

PS 2: Apple has got a couple of warehouses full with unsold 5200's.
In exactly 14 months and three days Steve Jobs will once again have
a brilliant idea (that's what he gets paid for), lets melt the whole
lot an turn them into.........(come to this group on 9th march 2000)

      Hum... TOS works on the PowerPC platform already? (And I don't mean
MagiC). How about applications, do they have to be compiled for PPC too?

Macworld Kicks Out Intergraph
(01/06/99, 3:28 p.m. ET)
By David Richards, Computer Reseller News
```

SAN FRANCISCO -- The organizers of Macworld Expo, held here, have stopped workstation manufacturer Intergraph Computer Systems from displaying Intel-based systems at its booth.

Intergraph, whose booth is located next to Apple's on the show floor, was set to demonstrate new Intel Xeon workstations running at 400-MHz and 450-MHz chips on Microsoft Windows NT-based multiprocessor workstations.

Sources said this conflicted with Apple's focus on its next-generation family of Macintosh G3 desktop systems, which are designed to compete with NT machines.

"We warned Intergraph prior to arriving that they could only run a Mac-clone environment running off an Intergraph Windows NT server," said Colin Crawford, president and CEO of Macworld Expo, a unit of IDG Expo Management Company. "What they turned up with was Windows NT workstations expecting to run them in a Mac-only environment. This was a sensitive issue: Apple didn't want it, I didn't want it, and we had to negotiate on it."

"It was unethical of them to turn up at a Mac function trying to woo Mac people to a Windows NT platform," Crawford added. "They were warned and now they have been banned. It is not our fault." IDG refused to comment.

But an IDG insider who asked not to be named said Intergraph would be compensated for having to leave because IDG feared a lawsuit. The source also said IDG enforced a clause in the contract that gave IDG the right to remove from Macworld anyone it deemed wasn't acting in the interest of the event. During his keynote Tuesday, Apple interim CEO Steve Jobs boasted about a powerful new 400-MHz G3 workstation, comparing it to an Intel-based workstation similar to what Intergraph was planning to demonstrate.

An Intergraph employee, who asked not to be identified, was skeptical about Jobs' demo.

"I would like to run the demo again on our systems, this time running ours or SGI's [Silicon Graphics Inc.] proprietary accelerator cards," the Intergraph employee said. When asked whether it was good business sense to market NT workstations to Mac users, Macworld's Crawford said, "It may be smart in their eyes, but I think it is plain dumb at a Mac function. I was under pressure from Apple, and we had to act."

This is not the first time Intergraph has used Macworld to attempt to lure Apple's core user base -- publishing, graphics, and design professionals -- to its workstations.

At both Macworld events last year, Huntsville, Ala.-based Intergraph stationed company representatives at many nearby hotels and on corners to pitch its products as an alternative to the Mac.

Sheesh - ya leave for a little while, and the come back to find people
actually expecting sinclap to have a point -  what's the world coming
to????

For anyone that's interested it's a 700k image of yet another idiotic
looking Mac - more style over substance.... "What's your favorite
color" indeed.

Terry Ross - and yes, I did view it with CAB.

Hiya there Apple sales rep. Well, after happily recommending Apple products to people that are contemplating purchasing a personal computer for almost two decades, I've not only stopped doing so, I've started making it a point to bring up the disadvantages of having one in their home. Do I dislike Apple? Nope, I dislike your attitude. My protest will not seriously hurt Apple in and of itself, but I get immense personal pleasure knowing that you've lost the company yet another sale. Hey, amongst the people I know and work with, it only works out to an average of three to four computers a month, but it's a start.

Terry Ross

        ^^^^^^^^^^
>shreds library book..

I DON'T BELIEVE IT! TIFKAS HAS CALLED A MACINTOSH JUNK!

A Mac IIci, TIFKAS, turned out to be just what my mother needed - ands she thanked me profusely for being so thoughtful for her Christmas present. It fits her needs quite nicely - upgradable to 128mB RAM, uses SCSI, colour, fast enought to run ClarisWorks, usable with her printer. Gee, even Apple mentions the IIci still on their web site (http://www.apple.com), and on comp.sys.mac.advocacy (you know, the place TIFKAS is too cowardly to post his drivel to because he'd be rendered Cajun-style in seconds :)) there was a thread about the feasability of using a IIci as a web machine (concensus - more than adequate with enough RAM) by actual Mac users with brains.....

The above, I see, speaks buckets about what TIFKAS thinks - "if it's old, it's no good, throw it away and spend thousands on the next big thing". Which is miles away from my attitude - "if it still works, and it fits your needs, it's still got a use". It's attitudes like TIFKAS' which leads to wasteful behaviour like throwing away entire computer systems in skips and the trash, when they can be donated to schools or even to places like Goodwill where someone who can better appreciate what an older computer can do can make better use of them.

BTW, it's spelled "cheapskate". Guess you were under the table at Pub 101 when spelling class was on......

>>   my mother wound up loving the Internet the minute she first got her
>> hands on it - at my brother's house on his Macs. In fact, it came in

>> search, we found the entire manual online!
>
>If you loved your mother you should of gotten her an iMac....now in five
>flavors..no pink yet...-)...

an iMac is something my mother DOESN'T want, believe it or not. She recognizes how crippled the system is, and it won't work with her existing hardware, or allow her to access her many floppy disks without having to shell out mucho dinero for something that should have been standard in the first place. Her IIci, OTOH, will work out just fine.

BTW, my mother also thinks you're an idiot.....

So, new colours - I guess if you can't sell the steak, sell the sizzle. New colours will certainly expand the Steve Jobs Reality-Distortion Field� to cover the now-less-overpriced, now-less-underpowered iMac's flaws.

BTW, Apple missed the boat - no basic black? And why no real Apple colours, like red or solid green?

>He he he...I have been busy for the last two weeks and already missed.
From
>the looks of the number of posts, time for sinclap to come back..

.....and get his virtual little hiney kicked.....

If thats her main use she does not need anymore unless she does a lot of
internet surfing. Like utilizing java and QT. I am a PowerUser, so my needs
are greater..

Apple Works 5 just needs an 020 to run. Quite amazing that updates require the bare minimum compared to MS Office releases..

> The above, I see, speaks buckets about what TIFKAS thinks - "if it's

I still stand by my view is that old computers like the CI's and 286, 386 and
486 should not be donated or be rejected if being donated...

Schools should have technology plans in place that have rational upgrade
cycles so they won't be left behind. I have been in many schools were video
production and media is used extensively.

And to [sic] bad, your precious Mac cannot teach you how to spell and use
grammar correctly.

Try "too bad", and then flame others for their writing.

Now complete the following:

People living in a house of glass.....

Oh, and I'm not a fan of Ataris (no offense to the Atari fans here), but I
don't spend the best years of my life like you, annoying people for their
choice.
```

```
> Soon to be issued a PB G3/266 to replace PB3400!

And which I hope tha helps you in:
1. Getting a clue.
2. Learning more about computers.
3. Finidng better things to do other than whining in advocay newsgroups about
conmputers that you don't use, and to be more specific to leave teh Amiga and
Atari newsgroups as you are a public annoyance to the people.

Hope this helps.

Aram Iskenderian.

Oh dear, God help all the readers.

<Quoted signature snipped>

I'm sorry but weren't you flaming another person earlier for allegdly leaving
"unwanted text" in his post?

Then what do you call someone who quotes the entire signature blaock?

All these years Peter, and you're still the same, you'll never change.
I give up.

Aram Iskenderian.

    this from our favorite boot-licker (especially Steve Jobs') :)

    Chrietien (aka  Da  Little Guy  From  Shawinigan) is  probably  best
remembered for two things as his career as PM:

    1) actually THROTTLING a protestor who got in his way at a
walkabout (and while wearing shades and black leather gloves!).

    2) when an intruder got inside the  PM's residence a few years  back
with the intention of killing him, Chrietien was waiting for him with an
Indian soapstone carving as a weapon.

    Does your gov. feel LUCKY? Does he, PUNK?

>>     Your gov. may be tough, but he'll have to get past the pepper  spray
>> first :)
```

>
>Navy Seals have taken pepper spray training..

so your gov. has to rely on Navy Seals to protect him? What a wimp! So much for defending himself against our PM mano et mano...

and as for your jingoism - remember, the last time the US made the mistake of picking on Canada (The war of 1812) their forces had their butts handed back to them on a platter with mint sauce on the side :)

Of course, we all know how weak you are on political science - just look at the impeachment. So much for your "the president can only be impeached for treason" screed.

>> products ....
[snipped]
>
>It's advocacy...Get Over It!

Precisely. It's advocacy. And I'm advocating that they don't put their money into Apple. My advocacy, incidently, has a lot more impact than yours, since I am talking to people that are actually considering purchasing a computer, and have questions. Whereas, yours is simply a matter of putting down the choice of what people have already spent their money on and are perfectly satisified with.

>Do you recommend the Milan beige box?

Let me put it like this. I don't recommend a Milan to the people that consider the color of their computer to be a significant factor. I have recommended a Milan, (or Hades, or used ST/TT/Falcon - or even Amiga) to people that understand that a computer is a tool and have expressed a desire for an alternative to Macs/Wintel boxes. The point is, I don't recommend Apple anymore, regardless of its intrinsic values, due to your attitude and generally robotic, brain-dead, "pick-an-answer-from-your-list-of-prewritten-comments" responses to anything posted on c.s.a.advocacy. So, you keep "advocating" here, where nobody is even vaguely interested. I'll keep advocating in the real world, where people have their wallets out, waiting to spend their money.

Terry Ross

>
>I still stand by my view is that old computers like the CI's and 286, 386 and
>486 should not be donated or be rejected if being donated...

again, a sign of TIFKAS' waster mentality. You'd be surprised how many of these "old, useless computers" can be placed to good use not only in schools but also in the homes of the underpriveliged and needy. There are many agencies in the US and Canada that often ask for and receive the "old, useless technology", and put it to best use rather than have it emolder in a landfill....

>
>Schools should have technology plans in place that have rational upgrade
>cycles so they won't be left behind. I have been in many schools were video
>production and media is used extensively.

but what if they don't have the BUDGET?

at the last Comdex here in Toronto, there was an organization called Computers For Schools whose goal is to get computers into schools who don't have much to spend on for a computer-learning budget - they will take even 286 computers, because they've gotten a special licence from the makers of what was originally called GeoWorks to install their operating systems on - and beleive me, these computers run like a little powerhouse. They've even included e-mail, USENET and WEB SURFING to the new version.

As for 386s - well, I believe that a donated 386 system with Linux installed would make a great little computer for future programmers in high schools to get started on....

Dear Apple: I would like to have The Idiot Forever Known As Sinclap

(1) neutered (x)
(2) transferred to your sales offices in Outer Siberia (x)
(3) take a bath - and have a plugged iMac thrown into it (x)
(4) forced to write "I will observe proper nettiquette" 1,000,000 times with a blunt crayon and have it newscast live on CNN (x)
(5) take anger-management courses in which he is cleansed of all his irrational hatred towards Atari users and feminists (x)

    oh? To pop a big hole in the Steve Jobs Reality-Distortion Field�?

    Steve Jobs did a demo that Intergraph saw were huge holes in it.
Intergraph was prepared to do a demo that threatened to blow away the
new Mac servers. Jobs had one of his oh-so-famous hissy fits and had
Intergraph (who had an agreement to be at the show) kicked out....

    Gee, which part of that couldn't you understand?.
>
>Goto PCExpo, Comdex or Amiexpro or maybe a once in a decade Atari show...

    gee, last Comdex I was at, Apple was conspicuous by their absence. I
don't see why they would bother to be at PC Expo. Apple does sometimes
show up at the twice-yearly Neuss show in Germany to try to sell the
points of running Atari emulators on their Macs (which I'd suggest
you'd go and visit after you extricate your foot from your mouth....)

as usual, TIFKAS is clutching at straws. So he now stoops so low as to suggest that users of the now-less-overpriced, now-less-underpowered iMac solve their lack of game software problem by using a Sony Playstation emulator.

Here's the problem, though:

1) the Playstation Emulator costs $90 US - and won't run all of the "hundreds of Playstation games". A REAL Sony Playstation, OTOH, costs from $90-129 US NEW (depending on which package you buy) and runs 100% of ALL Playstation titles. Now what is the better value?

2) in order to use the Playstation emulator, you must obtain a GENUINE PLAYSTATION OS ROM DUMPED TO DISK. The only legal way you can do this is if you actually OWN a Sony Playstation (again, $90-129 US - KA-CHING!). Do the math - is it better to just pay $90-129 US for a genuine Playstation that is 100% compatible with all games, or to spend $180-219 US to run a not-100%-compatible emulator on an iMac?

2a) those of the emulator's users who would forego #2 and actually PIRATE the ROM will soon discover just how much a sense of humour Sony's army of patent lawyers lacks (and last time I looked, software piracy/breach of copyright carries stiff fines, stiffer prison sentences, and potential lawsuits from the patent owners). Is it really worth it?

As usual, TIFKAS is a penny short, a pound foolish, and (like many Mac game titles) a year late!

see, TIFKAS is so clueless, he relies on a "NEWSwatcher USENET Reader Emulator" rather than set up the real thing. But then, when you have the collective IQ of a bag of pork rinds.....

What (iMac) rock have you been hiding under? There were multiple Atari shows (worldwide) last year, as there have been for many years, and there will be multiple shows this year as well...

Can't you at least make some semblance of being accurate when you post? How can anyone take you seriously (esp. as a Mac rep, as you claim) if you blatantly post such mistruths? I know I don't regard anything you say as worthy of my attention because of posts like the above...

well, it now looks like Sony has now made their move against the Connectix Playstation emulator for the now-less-overpriced, now-less-underpowered iMac mere DAYS after its release at MacWorld....

Grabbed from PSX.IGN.COM the Playstation News Page

"With an unsurprising stomp of the boot, Sony is filing an injunction against, and will then sue, Connectix. With much fanfare at the recent 1999 MacWorld Exposition, the codesmiths at the company well known for RAM Doubler and other products, announced their commercial PlayStation emulator, the Virtual Game Station, to the surprise of many. Especially Sony. But within two days of the show, a Sony representative allegedly purchased two of the units, and within a mere two days, the company plans Sony formed the backbone of its suit. Sony will sue for intellectual rights infringement on the illegal use of its patented game system."

and somewhere out in the US, TIFKAS (The Idiot Forever Known As Sinclap) is having a meal of crow - that is, as soon as he can get BOTH

I take it you're saying that he was, at one time, a Navy SEAL.  I'm
curious, does he go around yelling "WhoooooYahhhhhh!!!" at
inappropriate times and bumping into walls like a large percentage of
the Navy SEALS I know are likely to do?

Not to impugn the actual traing of the SEALS, which is admirable, for
the tasks assigned - but knowing quite a few of them, they're not
exactly the brightest lights on the Christmas tree.

Not to long ago...a chunky jihad stated that the iMac will not have midi capability because the maker of Cubase will not be available and others would follow..

Will here is the link that will cause a chunky ripple affect...

http://www.macprof.com/imacumace.html

Just for you 'Chunks'..and yes they do have just rev. B iMacs..

-- Positive FutureShop Report -- Halifax, NS: From reader John Christie, " I went to the local Future Shop (Halifax Nova Scotia) to check out the iMac this weekend. I couldn't stay long but my initial impressions are generally more positive than expected. Future Shop locally has generally had a terrible history with Mac products. I had no qualms about them dropping the Mac a while back because they were doing more harm than good with their disparaging attitude. However, this weekend I found something quite different occurring. They were actually overselling the iMac and exaggerating its capabilities. I listened to one customer ask about peripheral capability and the salesman gave blanket assurances that you can use the same peripherals as with PCs, no exceptions. And he seemed genuinely enthusiastic about selling the machine. I wonder if the spiffs are happening in Canada too? This was a regular Future Shop sales guy and from the way he attempted to demo audio CD's he seemed familiar with the Mac but not a guru or fanatic. They had an end cap display before entry into the rest of the computer section. It was an iMac/B attached to their top of the line computer sound system running the Tomb Raider 2 demo. The demo looked fabulous in high res. and anti-aliasing on (other than lighting I've never seen a system it looked better on). There were no Apple banners but it was surrounded by stacks of iMac boxes. For the 15 minutes I was in the store there were never less than 4 people trying to get a peek at the machine. NOTE: While in general I had seen salesmen steer people away from Macs when Future Shop had them in the past, I had found that coming in when they were not busy and playing with the machine like I knew what I was doing always attracted the interest of at least one employee. I worked on a Umax/180 for over an hour at a Moncton Future Shop and basically gave a tutorial to 2 of the sales people there. They were genuinely interested and reinforced a belief that much of the Future Shop problem was/is ignorance rather than bigotry. This is further reinforced by the fact that Future Shop is often very unknowledgeable about PC's too. If it was bigotry that would be less likely."

That's not a relevant comparison. Design compromises may have to be made to support higher clock speeds.

Forget about the MMU and the 386 is still better.

Actually, I'm not sure how the 68000 can be considered competitive.

It's funny that you do reply to Daniel but not to my replies. I've said made some shocking accusations against you, you know. Like being hypocritical and all, and the stuff about those G3 tests and such...

What's the matter, can't counter my arguments, afraid to face me, or do you just want to have your private little argumentative war with your imaginary friend Chunks?

sinclair2246@my-dejanews.com wrote in message

They're at least equally powerful - Calamus was the very first DTP app on ANY platform to feature a built-in softwarebased RIP.....

Have you taken a look at the list below?
The music studio apps on TOS machines used to be, or still are MORE powerful than their Mac varieties AND they were there first.

NO NO NO NO NO - It's your business to SELL SELL SELL.
Like I said before - you state "Gee I wonder why" about Microsoft Office on
the Mac (speed and feature comparison) but at the same time you
hypocritically make an equally weak and unfair comparison with Photoshop,
PageMaker et al. For those apps, Windows users could say "Gee I wonder why".
The same reason you could say "Gee I wonder why" on Ataris.

If you don't like the MS-Office comparison, your comparison of Photoshop and
other apps DOES NOT hold up to scrutiny. Wanna go to court on this?

```
>
>It's also true that MS has enginnered Office 97 to perform better than
Office

Again, this is BS and doding the discussions. So this is your level of
debate huh? Gee I'm impressed... I wonder how long you can actually hold on
to someone before they either decide you're to dumb for them or take
advantage of you.
>> >
>> >
>> >BS deleted below..
>>

>> posts - oh, but then they would be completely blank :)
>
>I deal in facts..Such as Atari was headed to heavan despite jagflop...Being
>rediculed because I was right...
No you don't deal in facts. You deal in TWISTED facts and IGNORANCE. You try
to sell other people's souls to another platform by bashing the one they own
now. Well guess what... it's NOT working. Selling doesn't work that way, no
matter how many quota you match. I guess the iMac must be for all those
people like you who don't understand one bit of anything that has a the word
"computer" in it. Do you know how to program your VCR? Oh I forgot... there
is no step 3. Just put it in the box, bring it back to the store and say
you're too stupid to own a computer.

Look - the above is an exaggeration of your level of debate. Please don't
judge people that you know not a thing about and one more thing: you're not
going to increase your sales by trolling this newsgroup. Find someone else
to sell your hypocritic double standards to.

>three found that Apple is blowing smoke....
Hmm I wouldn't mind to see a test by a Mac magazine either. But with a fair
comparison of apps which did not originate on the Mac. Maybe Cubase Audio or
Logic Audio (both originated on the Atari, btw) on both machines put to the
test.
>
>
>>

Well, we don't want that in ten minutes. We want to USE our computer for
other things first. Oh and eh.. don't you think ten minutes is a bit long?
Even compared to W98....
I get on the Internet less than 5 SECONDS after I configured a dial-up PP
connection (which took about 1 minute) on a Wintel system...

>>

    OS8 - requires at least 32mB to run. TOS 4 - 512kB. Even MagiC
requires just at least 2 mB to run. I call that "bloat".

>
>>   Learn to spell "equivalent".
>

>> deflect the truth.....
>
>What makes you think what Fred states is face value?

Fred is a professional writer in the computer industry - and he was former editor of BYTE. AND he knows how BYTEmarks work as a benchmark, and how Apple fudged the tests. What part of that don't you understand?

I note YOUR writer claims that iMac Rev B. "beats the pants off a Pentium 450" (my my, the bar has gone higher than even the Jobs Reality-Distortion Field� did the first time), but doesn't post collaborating numbers or tests results, or even what tests were performed so they came to that conclusion. A sign of a poor writer.

As usual, dodging the issue.

my my, you're getting really angry now - must mean I'm pushing the right buttons.... :)

It's my business to know the real facts involved when
>comparing the features as well as performance between G3's and Pentiums.
>It's a fact that apps like Photoshop, PageMaker, Director and so on perform
>as much as twice the speed of the same Pentium clock speed. Even the PC
>staff admitt that the G3's excell in performance.

and it's a fact that tests performed by three separate sources say that you're wrong. It's ALSO a fact that you're as dumb as a tree when it comes to any aspects of computers (remember when I reported a web site you were spamming us with came up a "404", and you sneered that I needed a new web browser? "404" means the ISP couldn't find the web site - nothing to do with the browser.) To the point that you have to make up FUD about Ataris and TOS....

```

since TIFKAS is still running around in la-la land among the elves and fairies and frogs in funny hats, swearing up and down that the iMac's G3 processor is faster than a 450mHz Pentium II, it's time I figured that he needs to be brought to earth.

Here's a VERY interesting post - complete with URLs - of a debate going on about the PC World tests between a Mac user and a PC user on comp.sys.mac.advocacy . It gets technical, but it's extremely well-written, especially from the PC user's point of view, and raises some excellent points.

TIFKAS may wish to copy this out and give it to his fellow underlings at the InCompUSAs he frequents.....

Before making all your baseless claims, why didn't you go to Packard Bell's web site and look up the details about the Multimedia 945?
(http://www.packardbell.com/products/98models/mu945.asp)

>1) the iMac, with a 233 Mhz G3 cpu
>
>2) Micro Express MicroFlex-c400A, with a Pentium II-400
>
>3) Packard Bell Multimedia 945 with a Celeron-333
>
>First check out the Mhz comparisons. Look stacked much? Right off the bat
>they look scared. Why not compare 233 Mhz PC machines with a 233 Mhz G3
>Mac, eh? I know why: The iMac would blatantly beat its butt.

I don't know why we have to keep explaining this one. There are at least 2 reasons to make such comparisons. First, the Celeron system costs less than the iMac. Most people compare systems on price, so that is a reasonable comparison IMO. Second, Steve Jobs himself invites the comparison between the iMac and the 400 Mhz PII. I quote:
"The iMac for $1,299 toasts the fastest PC money can buy at any price--the Pentium II 400," said Steve Jobs, Apple's interim CEO. ..."
(http://www.apple.com/pr/library/1998/aug/13fast.html)

>And then lets
>consider their price comparison argument: do their PC machines at such low
>prices include 100 Base-T Ethernet? Nope. Infrared networking? Nope, in
>fact no networking at all.

>6 MB of VRAM? Nope, only 2.

When they tested the iMac it only had 2 MB of VRAM and had the Rage IIc board compared to the Rage Pro in the Packard Bell. So, you say, the iMac is better configured now. True, but so are PCs.

>512 K backside level 2 cache? Nope, only 128K non-backside cache.

LOL! The 128 KB of *on-chip* L2 cache is much faster than back-side cache. Depending on the application, larger may be better than faster, and vice versa.

>USB? Apparenly Nope.

Do some better research. Of course it has USB.

>56K modem? Apparently Nope.

Yes

>Dual headphone jacks? Nope.

If that's important, spend $5 (if that much) on a splitter cable.

>CD-ROM drive of any speed? They don't say.

They don't say because it's obvious that it does. How can you install most software without a CD? For the record, it has a 32X CD-ROM which is faster then the iMac's 24X.

>All-in-one portable? No way!

True

>Runs both Mac and PC software? No Way!

Mostly true (there are some 68K emulators), and also mostly irrelevant.

>Next are the applications they chose, hilarious:

>1) Megalosoft Excel and Word 97 on the PC and Excel and Word 98 on the
>Mac. Yeah right, like Megalosoft ever cared how fast their software ran on
>a Mac. Any child familiar with Macs and PCs will tell you Megalosoft's
>software has been running slower on the Mac for AGES! Some test. Totally
>worthless.

I guess that's why it is one of the best-selling software packages for the Mac.

>2) Photoshop 5 on a 5 MB and 20 MB image. They don't bother to provide any
>details here, they just say "we applied filters and effects, followed by
>image resizing and color conversion operations." Really. Why? NO ONE
>should be running Photoshop on ANY of these computers! They all have 15
>inch monitors, which no one running Photoshop would use, except of course

>dimwit PC users who don't know better. I would NEVER advise anyone to use
>an iMac for Photoshop. AND add to that what I have to assume is the dirty
>trick they hid from us: That the "filters and effects" were written to be
>native for Intel chips at the request of Intel themselves just so they
>could have a couple tests at which their chips could beat a Mac. Yes, this
>is a fact: Intel went to Adobe and had them rewrite a number of their
>filters to use acceleration built into Intel chips. Sadly Adobe never
>bothered to rewrite the same filters to be native for G3 chips. Again, the
>test is totally worthless.

So what do you suggest?

>So here we have a stacked set of test, and wowie wow, the iMac lost. Big
>surprise.

What would you suggest as a fair test?

>And to really show off their evil look at what they say:
>
>1) "the world can't make up for slow application performance, poor
>sound quality, and no upgrade path."

How does that make them evil? Is everybody that thinks the iMac is
overpriced and underpowered evil?

>The slow applications are only the apps THEY CHOSE as faster on the PC in
>the first place.

So, contrary to many other Mac advocates, you are claiming that
Photoshop runs faster on the PC than on the Mac?

>The "poor sound quality" is better than any consumer level add-on speakers
>you can buy. Nice try.

It's true. Have you actually listened to the sound on PCs priced at
or below the iMac price?

>The "no upgrade path" they refer to is the monitor. Duh. The iMac is a
>portable all-in-one computer, with what PC World admit is a SUPERIOR video
>quality "yielding even focus and sharp, readable text." Of course its not
>upgradable. They are comparing the mobile iMac with a clucky collection
>interconnected boxes.

I guess all non-iMac Apple Macs are just "a clucky collection of
interconnecting boxes" as well.

>The stupidest insult: "interim CEO Steve Jobs' boast that the iMac is faster
>than the quickest Pentium II is pure hype--and it falls apart under scrutiny."
>
>WRONG. If they would bother to actually QUOTE what Apple says, and
>actually provide DETAILS about what Apple used for comparison THEIR HYPE
>would fall apart under scrutiny.

They did quote what *Steve Jobs* said: "The iMac for $1,299 toasts the fastest PC money can buy at any price--the Pentium II 400," said Steve Jobs, Apple's interim CEO. ..."
(http://www.apple.com/pr/library/1998/aug/13fast.html)

>What Apple PROVED:
>
>1) The iMac beats even a 450 Mhz Pentium II computer in BYTEmark Integer
>benchmarks. Period. "

How many times per week do you run BYTEmark on your Mac? What do you accomplish when you run BYTEmark on your Mac?

>The G3 runs as much as twice as fast as the Pentium
>II." There is not one bit of hype here, just facts. The hype is the crap
>PC World is trying to con us with.

LOL!

>2) The iMac wipes the floor with a 233 Mhz Pentium II machine when playing
>a Director multimedia presentation. Watching this live on stage
>demonstration, as you can on any retail store demo iMac, is incredibly
>pathetic. The PC was so far behind, was taking so long to complete
>compared to the iMac, that they gave up on it. When the same multimedia
>presentation was played on a 400 Mhz Pentium II machine and a K6 400 Mhz
>machine the results were less devastating, but the iMac beat the 400
>Pentium II by at least a factor of 2, and beat the K2 at what was at least
>a factor of 3.

I have never seen these data published (not even on Apple's web site). I am aware of the demonstration, but I've never seen any actual numbers.

Here are a number of real-world application tests showing a general advantage for PII systems over G3 sytems:

http://www.zdnet.com/pcmag/firstlooks/9808/imac_tests.html
http://www.zdnet.com/pcmag/firstlooks/9810/f981002a.html
http://www2.pcworld.com/pcwtoday/article/0,1510,7801,00.html
http://www.techweb.com/wire/story/TWB19980821S0021
http://www.cnn.com/TECH/computing/9811/09/macvp2.idg/
http://newmedia.com/newmedia/98/09/labnotes/Apple_G3_Workstation.html

Now, it's all very well to criticize any of these benchmarks/tests as biased, but do you have any real data to contradict them?

>And guess what? The tests Apple did actually represent what iMac users
>would typically do with their computers! And the applications and
>benchmarks they chose were NOT biased toward the Mac!

LOL! You think that people with iMacs will not be using MS Office or Photoshop, but they will be using Director? You also think that Apple's tests are not biased in favor of Apple? Really????

>So who would you consider more honest? Apple or PC World.
>
>Answer: Apple.

Correct Answer: PC World.

>The loser in honesty?
>
>PC World.

Correct Answer: You.

****

The iMac may be a good choice for some people. However, trying to
make a case for the iMac based on performance is a waste of time IMO.

-Steve

The only thing certain about the future is that it hasn't happened yet.

these imac advocates are so intent at slamming pcworld's review that they
forget 1 important factor - it doesn't matter that excel & word for mac
haven't been as optimized for thier platform, a good review for the typical
user is one that shows performance using typical products off the shelf.
They could build a machine 10 times faster than a pc, but if the software is
20 times slower it still results in a slower machine. period.

On the contrary, it IS a relevant comparison. The mostly made comparison
between PC's and 68K machines is irrelevant BECAUSE of the design
differences, and therefore canNOT reliably show the differences between JUST
the CPU's.

>
>> And the results of that comparison heavily depend on the importance of

As I have said many many times before, I agree on you that the 386 is a CPU
to be higher classed than a 68000. I also said that I would have it compete
against either a 68020 or a 68030, as I classify the 386 inbetween those two
68K processors.

I simply added in the last post that the "usefulness" if you will, depends
really very much on what you actually need and how this is implemented or
tuned into a system. I never disputed the class differences between plain
68000 and plain 80386 CPU's.

By pricing and use. If you can put two 68K's in a system versus one 386 for
the same price, then that would give you a definite advantage either way,
depending on what your system is intended to be used for or with.

Thanks for a good laugh. :-)
Real power without the price... and now the Mac is even called a "PC". What a shame for such a fine product. I wouldn't dare call my Atari a PC, it'd be quite an insult!

Well, like most contemporary Atari systems, it's European. The Mac is not.
So it's likely to be more difficult to get a hold of one in America.

The reverse is true for Macs as well. There are only a few stores throughout
Europe who ACTIVELY market iMacs AND put them on the shelves.

Since when is a Mac a PC? You're insulting your own systems now? The
"Personal Computer" was a design by IBM, cloned by many others.

And we do have powerapps for those who need them. His issue is not with
quality, but with QUANTITY. Which is probably why he chose Wintel and not
Mac.

     Or 4 68000's. I know of a hospital that was using a

     4x68000 system well into the 386 era.

To support high clock speeds you have to limit the complexity of your instruction set. If you tasked me with designing the fastest microprocessor with a clock limit of 8MHz then I would design it differently than if this limit was not imposed. Look at DEC and HP. They produce micropressors that are competitive with respect to speed but the HP chips can only be clocked to about 1/3 of the rate of the DEC chips. Does that mean that the HP chips are faster?

> It's performance overlaps that of a CPU 6 years newer.

What CPU are we talking about?

We weren't talking about the machines. I'm just comparing the CPUs.

You where talking systems? That's odd since you were using the names of
micropressors in your posts and not the names of systems.

> >Actually, I'm not sure how the 68000 can be considered competitive.

Actually, the 386 can retire most instructions over twice as fast as the 68000
and the glue logic is going to hurt you in the dual 68000 system.

Which is why RISC processors could traditionally be clocked at a higher rate than CISC processors. At a given time, complexity of your instruction set is an issue. But as technology advances, it will be less of an issue with newer technologies to put components closer together, or radical new designs.

In the beginning, CISC processors were highly succesful BECAUSE of their complex instruction set, and RISC was fast, but too expensive since to take full advantage of their clock speeds and efficiciency, other system components, or at least parts thereof, needed to be modified or designed to take advantage of the RISC characteristics. With the introduction of narrower and more advanced production methods, this became that one step for production - a giant leap for mankind thing that made RISC affordable and feasible to compete against CISC systems. Until sometime in the future, boundaries are about to be reached again.

I think this will go on and on and on and on with some fusion between CISC and RISC technology (CRISP?) avery now and then.

All this makes it still, a matter of perspective, point of view at a given point in time.

>
>What CPU are we talking about?

He didn't say, but I think he tried to imply the 68000. I would more likely look at the introduction of the 386 and the 020, or even the 030.

>You where talking systems? That's odd since you were using the names of
>micropressors in your posts and not the names of systems.
No I was not. I just leveled the value of a pure CPU comparison. As you may
recall, the original thread or branch of thread that went into the 386 vs
68K thing came from Clockmeister. And he meant a comparison of CPU's bearing
in mind the way they are commonly implemented. Yes it's not a completely
fair agreement, but if you do compare in that way, then I think it MIGHT be
possible to view performance differences as such.

I tried to show that it is virtually impossible to compare just the CPU's
considering the different ways these are commonly implemented. I did
however, agree on you from the purely CPU point of view (as you can read
above). I merely tried to say that I can imagine that a lowlier CPU can be
used in a competitive _way_ e.g. be implemented in a way that a _system_
(yes, system) can be built to compete against a 386. Ofcourse, I would
normally just compare 020, 030 and 386 (as I've stated before).

The "comparing systems" you are talking about was in pursuit of things that
others have already said and were to show that I can imagine how people can
view differences that way. Furthermore, I did not mention systems by names
because I meant the most common use of the CPU's in those systems, how they
were addressed, used, implemented and operated, regardless of operating
system or hardware architecture. This is quite different for Intels and
Motorolas.

>
>> >Actually, I'm not sure how the 68000 can be considered competitive.
>> By pricing and use. If you can put two 68K's in a system versus one 386
for
>> the same price, then that would give you a definite advantage either way,

>
>Actually, the 386 can retire most instructions over twice as fast as the
68000
>and the glue logic is going to hurt you in the dual 68000 system.
And that is why I said "depending on what your system is inteded to be used
for or with". I don't know how much a 386 costs these days, I do know a 68K
has been cheap for ages. Wasn't it around from 1979 onwards??

Again, I do not dispute differences at processor level. I just try to say
that the USEFULNESS of either processor given their characteristics, and
even more important in some cases, their BEHAVIOUR (i.e. bus efficiency,
overheadtime, implementation-dependant) heavily depends on
a) WHAT do you want to use the system for?
b) HOW is the CPU used in that system.
c) HOW MUCH does all this cost?
d) WHAT is in the CPU's microcode and HOW is it going to help you

That's all I tried to say, really. Again, why should I be discussing purely CPU's with you as we ALREADY agreed on that SEVERAL times? (just re-read this post :-)

:-)

Web site udpating:

After technical problem with our accommodation, our web site was broken. Actually, he is running correctly with many modifications in bonus.

- a page with french and foreigners distributors.
- a page with various links wich claims to grow...
- a quick access to tested softwares on CENTurbo II (163 refenrences).
- a CT2 FAQ in the softwares page of CENTurbo II menu.
- new version of CBOOT 1.0.8, PUTFLASH 1.0.8 + FLASH.BIN 1.0.2, CENTscreen 3.4.0, VIDEOMOD 1.2.0. All from 12/08/1998.
- new version of CENTview 2.9.0 from 11/25/1998.
- new version of CECILE Demo 1.84 form 11/10/1998.
- new version of SANDRINE Demo 3.0 from 05/11/1998 that you can use to really scan but with colorless :-)

CENTurbo II: Available in January 1999

The CENTurbo II revision B is in productions. She will have a new hand-made Fast-Ram controller (same on the Phenix) and more quickly.

A better integration permited to decrease the price to 1890FF TTC !

The serie will be limited, contact your resellers...

Phenix:

The prototype is routing phase according to the last implantation (see Phenix page).

We finish the USB and PCI validation at the moment (hardware and software!).

The DSP+20-bit audio part is valid.

Thanks for your attention.

yep - despite TIFKAS swearing up and down that the iMac's graphics card was speedy despite the fact that it was old technology, Apple disagreed with him (partially due to pressure from customers) and put in a better graphics card. They still soldered it in, though....

Apple also put a real reset button on the rev. B - when the A release locked up, you had to reset it using a bent paper clip through a tiny hole in the back. NOT a good design feature :)

They've also included OS 8.5, which adds some nice new features (including Sherlock, which I was taken with, this is a neat Internet innovation).

So now it's a bit less underpowered than the original release (though far from "blowing the doors off a 450mHz Pentium II" - honestly, is Don Crabb on crack?).

Still overpriced, though - but rumours are going on in comp.sys.mac.advocacy that after MacWorld Apple will be slicing $300 US off the retail price. Make it $500 and you may have a customer here :)

BTW, Bengy Collins (the MagiC maven on the net) has bought an iMac himself, and has been experimenting with MagiCMac on it - he reports very good results, if anything it makes a nice TOS clone that's definitely peppy :)

A note to TIFKAS - guess which computer is also NOT mentioned on Future Shop's web site? (http://www.futureshop.com) Particularly the Canadian site. The iMac seems to be Future Shop's "our little secret" - doing a search on "iMac" only brings up the iMation Super Disk.....

Yea, I remembered that issue.  I think I still have it in storage.  Use to
read Bruce Webster's articles on the 68K wars. I did consider the 1040 at
one time due to price but went with the Amiga because it was more advance and
available. It took Atari months to ship the 1040's to the U.S. shore after
the Byte publication.  Atari's excuse at the time I believe was that
shipments were delayed in the Philippines due to the revolution against the
Marcos regime..

Yes there is and you know who it is.. I do have a life thats why I post at
this hour..

Ease of use, ease of instalation, simplicity and simplified upkeep...

> If you don't like the MS-Office comparison, your comparison of Photoshop and
> other apps DOES NOT hold up to scrutiny. Wanna go to court on this?

I have no issue with the MS comparison. MS office 98 is slightly slower than
Office 97. However, when usuing multimedia thats were the G3's shine.

> >
> >It's also true that MS has enginnered Office 97 to perform better than
> Office

"Same clock speed" is hardly an issue when comparing different
processors with different operating systems.
If it is, then please compare Calamus, Apex or Papyrus on a 16 MHz Atari
with an equivalent (or almost) program on a 16 MHz PC or Mac...

```

This year. Point your oh so good browser to www.milan-computer.de
Progress? Bull shit. Sales bullshit. Everyone knows that the best hardware
vendor is, ironically, Microsoft - they creat the NEED for those upgrades.
Did it make the computers do anything they couldn't do before, or better?
No...

Atarians only buy REAL upgrades. Do  you know how many service packs there
are for all those Microshitty apps? Not to mention the HUGE array of
hotfixes...

You do realize that Atari an AMERICAN company? They also have production
facilities in the U.S. or, at later times, used those of IBM.

>the Byte publication. Atari's excuse at the time I believe was that
>shipments were delayed in the Philippines due to the revolution against the
>Marcos regime..
Complete and utter bullshit. For the first time in Atari history, machines
were being shipped to Europe first because:

1) at the time the Europeans were prepared to pay a higher price for their
computers

2) the Europeans showed a more lucrative and greater market with less competition from other manufacturers at the time

This was purely a management decision. A bad one from the marketing point of view because many American Atari customers felt "left out", "abandoned" (much like the European Mac buyers really :-0) but a good one from a purely financial point of view. Remember that the Tramiels bought only PART of Atari (the home computer division) which was severely crippled by the Warner Bros. management. It was a mess and the first objective was to make it healthy financially. That is the only thing I have to give the Tramiels credit for. Atari always had enough cash in resere - they're good financial guys, but sadly the poorest marketeers I've ever come across. Well, unlike Apple, at least they didn't lie and/or bend the truth about their machines capabilities...

>
>So what happened?
It got ported to the Mac and Windows NT (NT _ONLY_) as well. The Mac version
died I think. It's still reasonably popular but lacks the broad support that
the traditional establishment of DTP apps have. Calamus is more popular in
Europe than elsewhere.

You really don't know shit, do you? I mean - chunks is not a form of spam.
Spam is unsollicited E-mail or postings that are normally not relevant to
recipient and unasked for. Apple press releases are normally relevant to the
comp.sys.atari.advocacy newsgroup. I can understand if you crosspost it to
say comp.sys.atari.st or something, because you want to convince these users
to convert to iMacs or something but certainly the .advocacy part in the
```

newsgroup name gives a very clear signal that these postings ARE irrelevant
and therefore UNWANTED SPAM which constitutes poor nettiquette.

^^^^^^^^ that too!

NO - The PC, or, PERSONAL COMPUTER, is a patented and copyrighted hardware
architecture devised by IBM around an Intel microprocessor, the Intel 8086.
What we refer to today as the "Wintel" platform is what's called "PC" or
PERSONAL COMPUTER or PRETTY CONTEMPTIBLE.

There are, besides the PC, a couple of varieties:

The PCjr (IBM's "1040" with 320x200 in 16 colors and three monophonic beeps
in stead of one) - after it failed miserably in the market, Tandy based it's
PC compatibles for a long time on this and added such things as a DAC.

The PC/XT (eXtended Technology) - based around a i8088, with eight 8-bit ISA
slots, 20MB hard disk drive, and a floppy drive. Support for cassette only
in BIOS (PC had a connector for it).

The PC/AT (Advanced Technology). The 286 machines and upwards.

Why do you think the phrase "PC-compatible" was invented?

If it's your business to know these things, then study a bit harder! :-)

     The term is 'microcomputer' for those who came in
     after Microsoft came to dominate the industry and
     even get drooling MacVocates like Petey-boy to call
     their machines PC's.

I know where Chris was - but - last time I tried his 'phone was OS and
I have been told he isn't doing Atari stuff any more having moved over
to Mac out of his home.

I have no problem with Edmonton, by the way, just so long as they keep
losing to Calgary (we won't count the Flames - everyone whups them !)

Which was exactly my point. So who's mistaken here? As for 16-bit and
8-bit... we could also crop up the 8086 (fully 16 bit, but limited to 1 meg
of memory), 8088 (8-bit databus, otherwise like 8086), the 80186, 80188 (yes
they exist), the 80286 - the first of the Intels to offer 24-bit memory
addressing (16 megs), etc.

In retrospect, I would technically place a 68030 just above a 386 (later
renamed 386DX) because of the latter's lack of internal cache. They are
furthermore both 32-bit in all conceivable ways and both support an external
floating point unit and have built-in PMMU's.

This slightly alters my version of the scales (read thread).

chip.

The width of the databus does not define bitness of the CPU itself for me, but it does say something about system performance at "system" bitness, although only the system's main bus is the issue then, which for a great deal decides system performance, but not exclusively and can be leveled or compromised by other factors e.g. custom chips with dedicated memory and ports, in the system.

BTW - Be careful not to confuse external buswidth with internal buswidth or registers :-)

That is also why SCSI is usually a more intelligent but also more expensive choice as opposed to IDE, which requires support from the main system's CPU and mainboard e.g. system's bus. A 486 with SCSI hard drive can run

significantly better with Linux or WinNT than a Pentium with IDE. It depends
on what's measured as SCSI devices only need some instructions and then go
fiddling on their own. (The SCSI vs. IDE issue is only provided as an
example, I don't want to start yet another thread on it).

a similar thought - wouldn't it be great if ASH went and programmed
a version of MagiCPC that would bypass Windows 9x and install itself as
the only operating system?

I know the problem would be adapting the code that works so well
with Motorola processors to the Intel architecture, but boy, by
bypassing Windows I bet you'd have a TOS architecture that would really
scream :)

I know Dan Wilga from Gribnif has for years been innundated with
requests to port Neodesk over to PC to replace Windows' desktop with
something way more intuitive.

One thing for certain - whichever way it's done, it should be done
with the same ability to bring the operating system down to a nice
tight size. PC users would not only find a faster computer, they'd also
find more room on their hard drive - and the ability to put lots of
similarly tightly-coded programs on their hard drive :)

Now - my dear Dan - you have hit on the nugget of an absolutely marvelous idea - but - is Linux not almost already there - or have I got the wrong end of the stick (by itself, not an unusual situation for me !!!)

Don't worry, I'm borderline suicidal for writing that.

And since the esteemed writer has shown they have never heard of a "loss leader" in retailing. this tactic will result in some extra sales. But it will also bring in folks who end up buying a PC or some other electronic gear or appliance once they are in the store. If they sell something at a loss, that cost could be written of in terms of Advertising expenses, so its not like they really lose any money. What they gain is customers.
>
> Too bad sinclair doesn't understand retailing..

Not!...Want to try again? I am in the thick of it. Making sure that my CompU stores APPL inventory is flowing smoothly. I just have to be choosy with words in this public forum. All is well...

This is to easy...What you are saying is that you need a wintel box because
the TT can't suit your needs due to the software angle. Thats in stark
contrast to the Atari Jihads who rant that we got it all and who needs a
modern PC(wintel or mac).

He stated that the speed was below common Pentium speeds in the 350mhz+. He
stated that truthfuly. I disagree with his numbers. More like P75-100
numbers.

It's my letter, I can do what I want with it. There was no disclaimers. It
was not a personal attack since it was entirly posted as is...

So whats stopping you? You don't have to use wintels and macs...Why being so
defensive? Its just a computer..

>   And if I want Netscape, I can easily run and load Linux, compile,
> serve. End of story.

Why? cab not good enough?

>   You still haven't explained why you hold up a WINTEL system against

Because the letter stated that the Hades was equivelant to a 200-300mhz
Pentium box which the entry level G3's blow it away. No mention of mac
performance. He was making comparison with Pentiums period..

Does that include the Hades as well? Because you can find cheaper wintel
boxes that are faster than Hades for alot less.

Have you told Compaq this?   .

Can '10' Tos fans be wrong? The reason is that CompUSA or Apple will not
divulge is for competitive reasons. Apple does not want Compaq to know until
later. I am sure Jobs will divulge at MacWorld next month. I know the comp
numbers I just can't say.

Look...It doesn't matter to me implying I am being humiliated here which maybe
in your eyes.. You are the one who is getting bent out of shape here not me..

It's a computer not a religion. You are too easy.. I am here after hours
being entertained.. Thanks.

>was not a personal attack since it was entirly posted as is...

read the above again. It was not YOUR letter, it was Edward's
letter TO you. It was meant to be private. You considered it an attack
against you and you did what you did with it, violating nettiquette in
the process.

>>   I'm not dodging the issue - seems you are. Why should I want to run

then why do you constantly insult the intelligence of all those who
use Atari computers, and constantly printing up FUD? Does this sound
like someone tolerant of all computer platforms? You're the one who
starts the insults by referring to us as a "Jihad" and as "Atari boobs".
Remember too that I DO use a Mac as well.

>
>>   And if I want Netscape, I can easily run and load Linux, compile,

                              ^^^^^

    coming from someone who can't even SPELL "tooth fairy". Again, it's
legit.

    The fantasy stuff is Apple's claims of superior G3 speed (remember,
it was Steve "arrogant bonehead" Jobs who claimed that an iMac could
"toast a 400 mHZ Pentium"). The graph that Apple uses in the iMac
pamphlet continues with the distortion - it's just three lines with NO
real-world numbers (only with a snail at the head of the one for the
PC)- the same type of graph that Ronald Reagan was criticized for when
he tried to use it to stop a Congress-backed budget from going through.
At least three independant tests were done by PC magazines, and all
three found that Apple is blowing smoke....

>
>I am sure that a first time user who wants to get on the internet in ten
>minutes will shop around for components...
>
>As for building the G3 for less cost is already less...

    HMMM, a G3 tower runs at around $ 2500-4000 CDN. I'm sure that if I
could get a motherboard and the rest of the components (graphics cards,
hard drives and the like) I guess I could build it for much less. Too
bad I can't buy the motherboard.....

>in your eyes.. You are the one who is getting bent out of shape here not me..

    Nope, you ARE being humiliated. As a matter of fact, any Atarian
who I've talked to in conversation laughs hard whenever your name comes
up. No matter where I've gone in the world, your name comes up and
immediately there's fits of laughter at your expense.

>
>It's a computer not a religion. You are too easy..

    coming from someone who treats any Macintosh as a religion. Now
there is true pot/kettle/black.......

 I am here after hours

>He he he he.. Defending yourself..

    Nope, just stating the facts. In fact, yesterday WAS a good day -
got a lot of shopping done. Even went into a Mac dealer and tried out
Sherlock (they actually had it online - I must say, I am impressed).

    I must admit, Linux IS intriguing. We had a TAF meeting on this
back in October, and although the guest speaker didn't arrive (he
must've thought he was going to speak to a bunch of 2600 enthusiasts :))
a former member of the club, Dr. Hugh Redelmeyer, spoke in his stead
and wonderfully explained how Linux could make a big difference. In any
case, right now we have at least two people working on getting Linux to
run on our respective Falcons, and I may take a stab at it if someone
could provide me with the proper resources.

    Of course, I can also pick up a SCSI-based IBM PS/2 486 for $99
right now, so that, a CD ROM unit and Red hat and I'll be laughing :)

     Unix could use a low power GUI with some apps available for
     it. While X is nice, it still has the same approximate bloat
     factor as MacOS or WinXX. GEM/svga & GEM/X if done right could
     fill a void left by the current insanity in Linux regarding
     emulating Windows as much as possible (in app style & such).

Not really. That merely implies that the 'market isn't there'
because everyone's been thinking that the 'market isn't there'
which plagues those exact same overpriced powermacs of yours
too.

     No, what's cause for suicidal tendencies is to go
     from the flat memory gem that is GEM to a '93 version
     of DOS where you need to tell each of your device
     drivers where to go into memory because the nasty
     (DOS) is still programmed as if it were to be running
     on a 8088.

     68008 ~ 80386 is quite the appropriate comparison.

yup - that's the ticket !

I can buy a Compaq with 128mb, 8gb HD, 56k and MS office bundle with 15" monitor for about $2,200 (Canadian yet) with a printer chucked in - the Mac G3 similarly equipped, no software and no printer, will set me back about $3,500 Canadian.

The high price of Apple product & peripherals murders the average consumer.

Guess again 'Chunks'....

Comment on the [Macs Only!] Future shop report.

All Future shop stores will be trained the training is being done store by store though so it may take a week or so.

Second like all other retail store the endcaps on every isle are sold to different manufacturers generally for one month at a time which means that on Tuesday the iMac should be in a better place with proper sings.

Third although Computer City Canada has been bought by Future Shop our service will not change. They are commented to running us individually.

As a side not iMac sales are going really well at all Computer City Canada stores we expect about 100 units to arrive this week above the 40 we got 10 days ago this goes for all the store.

To all Macs Only readers please comment on the Computer City Mac Store and tell us how we can do better

Thanks,
Mitri Dahdaly
Computer City Apple sales specialist

Peter S.

Nope. The 386 has a MMU, a 32-bit address bus, coprocessor support and a 16 or
32-bit address bus. The 68008 has none of these.

The following is an interesting article about Apple from someone WHO DOES know his
facts about Apple. To my fellow Atarians I apologize in advance for the size of
this
post and the decidedly windows slant. However many of Fred's point would apply in
a
positive light to Atari's GEM and even Amiga's OS.(Lean superior programs running
faster on slower machines then bloated code running on screamers)

It explains in beautiful detail the problem with TIFKAS

Taken From The CMP Techweb site . The Langaletter editorial for this week

Correcting MacMisinformation
(12/01/98; 9:00 a.m. ET)
OPINION
By Fred Langa

Due to a huge number of incendiary posts, many clarifying notes about last week�s column,"Apple�s Heavy Hand," got lost in the sauce. Here are answers to some of your questions: A record number of people wrote about my last column Apple's Heavy Hand. The column was about a number of Apple�s practices and policies that I found deeply troubling -- deceptive ads, a renewed anti-clone policy, etc.

Much of the e-mail and posts were from Mac fans who felt I had unfairly maligned Apple or the Mac or Mac users. Some of the posted replies were cogent, thoughtful, and asked good questions or raised good points. Alas, hundreds and hundreds of e-mail and posts were just plain silly, scatological or obscene diatribes and personal attacks against me for saying something negative about Apple.

With the enormous volume of posts, some answers to the good questions got lost in the rubble. Please let me correct that here.

"What deceptive advertising?" I said that Apple�s ads about the speed of the G3 and iMac were intentionally deceptive (though legal), and I stand by that statement 100 percent. But large numbers of people wrote to tell me that Apple�s claims were proven by the BYTE Magazine "BYTEmark" tests, which Apple cited in the fine print at the bottom of its ads. (The irony in this is that I was the editor in chief of BYTE for four years. I know what the misquoted benchmarks do and do not do.)

Apple used the BYTEmark tests to create the impression that the G3, in general, and the iMac, in particular, are as fast or faster than top-of-the-line Pentium IIs. Steve Jobs also reinforced this with comments he made at the iMac rollout; he was quoted as saying the 233-MHz iMac would outperform a 400-MHz Pentium II. The one test where the G3 did actually beat Pentiums was BYTE�s low-level CPU integer benchmark. In that one part of the multi-part chip-level tests, the G3 was faster.

Note that I said, "chip-level." The BTYEmark test in question is a CPU test, not a system test. CPU tests are academically interesting as long as you realize that a CPU by itself is nothing; the only thing that matters in the real world is how the overall hardware and software perform running real applications. Numerous third-party real-world applications tests (NSTL, ZD Labs, PC World�) show the G3 systems running real-world applications generally lag behind similarly-clocked Pentiums. There are some areas where a G3 Mac has a slight speed edge, but overall, Macs tend to be a bit slower than similarly clocked Pentiums. So, Apple took a small, almost meaningless sub-test and used it to create the impression that G3s and iMacs have an inherent speed advantage over high-end Pentium II boxes. That Apple wildly succeeded in fooling many people is evidenced in last week�s posts. But it�s just not true.The ads clearly were deceptive.

"Fred�s in Bill Gates� back pocket. He�s just a shill for Microsoft." If you check the TechWeb and CMPnet's archives, you'll see that I�ve criticized Microsoft far more than I have any other company. In fact, by amusing coincidence, I wrote the current Windows Magazine cover story called "Win98 Bugs and Fixes."

But some Mac users equate saying anything negative about Apple with being blindly pro-Microsoft --- even in the face of overwhelming evidence to the contrary. That�s too bad because it shuts off debate. The reality is that all companies make mistakes. It's not right to treat Apple as a sacred cow. When it fouls up, it deserves criticism -- same as Microsoft, Sun, IBM, or anyone else.

"How does Apple pander to �ugly emotions�?" I've only critiqued Apple a handful of times over many years, but each time I�ve gotten amazingly virulent responses from the Mac community. As mentioned above, after the last column, I got e-mail-bombed (hundreds of duplicate, obscene letters intended to disrupt my e-mail service); and the public-posting area was flooded with writings of incredible hatred and rage.

In marked contrast, despite my frequent criticizing of Microsoft, not once, ever, has even the most rabid Windows fan called me an "Apple shill" or claimed that I�m "in Steve Jobs� back pocket." I�ve also never -- not even once -- received a hate-filled, obscene note from a Windows fan as a result of my criticizing Microsoft. Why is this? Why is it that, unlike users of most other product, some Mac users behave so poorly? Why do some Mac users fail to follow the basic rules of civilized discourse and debate when the subject is Apple or the Mac?

I believe Apple itself is partly to blame. It�s fostered some of these very bad attitudes among its customers with 10 years of ads telling its customers not that their computers are better, but that they as people are better: They're smarter, more creative, more independent -- they "think different." The implication in the ads is that if you use a Mac, you�ll be like Einstein, Picasso, or John Lennon.

While you might discount as hype any advertising message that claims "you're different; you're better; the normal rules don't apply to you," some significant number of Mac users seem to have taken it quite literally. If this sounds Far-fetched, look at last week�s posts: You�ll see Apple customers believing and behaving as if they're somehow better then the rest of the world, and that the normal rules don't apply to them. It�s astonishing: You�ll see posts filled with utmost arrogance; statements alleging that Mac users are somehow personally superior to users of other operating systems; and more. Many, many of the posts reacted to my critique of Apple as if I somehow were directly attacking them, the Mac users. One user spelled it out in a heated message where he said that criticizing Apple was the same as criticizing his Mac, which was the same as criticizing a family member. (I am not making this up.)

This level of fervor almost sounds funny when reported as I just did. But I got more than 500 of the most obscene, disgusting, hate-filled e-mail you can imagine from these same fanatics, and I assure you it�s not humorous at all.

Although anyone who sends e-mail-bombs or posts a scatological, obscene note in a forum is responsible for his own actions, I do believe the Apple "you are superior, you are different, you are better" ads have a lot to do with cultivating and pandering to these ugly emotions.

"You�re insulting to Mac users." I draw a huge distinction between ordinary Mac users who elect to use their Macs for good reason, and the Mac fanatics who posted the hate-filled, obscene, offensive flames in last week�s discussion.

These latter are people who apparently cannot tell where their computers end and their own egos begin. They regard any criticism of their choice of computing platform as if it were a personal attack on them, and respond with a personal attack of their own.

It�s silly and more than a little sad. Computers are supposed to be tools; they�re not extensions of our persons any more than a hammer or a paintbrush is an extension of ourselves. As products created by human organizations, all OSes and all hardware contains flaws. Rational people accept that and can discuss the flaws and strengths of their computers and operating systems in a rational manner. But some significant chunk of the Mac user base cannot.

Those are the people I have an issue with, not the rational Mac users. "Tell me one thing Microsoft innovated." How about a successful GUI on ubiquitous, low-cost, non-proprietary hardware? "How can you say OS 8.5 plays catch-up to Windows?" It�s no secret the Mac OS stagnated for many years as Apple foundered. (One example: Until Mac OS 8.5 the Mac Open and Save dialogs hadn�t significantly changed in years.) In updating the look and feel of the OS, Apple employed many of the features and functions in 8.0 and 8.5 that previously had been available in Windows 3.x, Windows 95, and Windows 98.

For example, the ability to alter the menu bar's type, size, and color; the look of windows, scroll bars, and icons; sounds and animations; anti-aliased text; etc.; all have been part of Windows for years. Other things such as built in system- and Internet searches debuted in Windows 95; and local full-text indexing appeared via free add-on in Windows shortly thereafter. "Live scrolling" and the resizing "thumb" have been in Windows for quite awhile, as have "command-tab" switching between apps, an icon-based palette of running apps, and drag-and-drop printing. Even under the covers, the Mac is playing catch-up in some areas. For example, a Mac now can reliably retain a TCP/IP address across reboots, and finally show up properly in DHCP lists; Windows has done this for years. There�s more, but you get the idea.

There�s no shame in borrowing a good idea. I don�t know why some Mac users have such a hard time with it. It�s especially baffling in light of the fact that all the most important, core elements of today's GUIs (windows, icons, mice, pointers, WYSIWYG text, etc) actually originated at Xerox in the Alto, which predated the Mac by fully 10 years; Apple borrowed these ideas, and built on them. When the Mac appeared, Apple did add many refinements and also did a great job of packaging them. (We'll charitably ignore the Lisa). The volume of Mac sales did change the face of computing, and that�s something for which we all owe Apple a debt of gratitude.

Later, various versions of Windows obviously borrowed many features from both Xerox and Apple. And today: Mac OS 8.5 borrows a number of refinements that appeared first in more recent versions of Windows. So? What�s to freak out about? Neither Gates nor Jobs is a dummy; they each know a good thing when they see it, and they're not ashamed to borrow ("steal" is the word many Mac people use) a good idea. All companies crib from each other. Why is it so hard for some Mac users to accept this?

"Your article is based on opinion." Yes, exactly right. It was an opinion column. It was clearly labeled as "opinion" in its header, and it resided in the "opinion" section of TechWeb. It was not a review or a news story, and it wasn�t presented as such.

"Your entire [Apple is anti-clone/OS 8.5 upgrade bug] case rests on 1,000 reports of damaged hard drives." Not exactly. Apple did effectively kill off its system cloners; and it does maintain an "Apple only" support policy. Apple is demonstrably very clone-hostile.

Be that as it may, the Mac OS 8.5 upgrade-bug situation was less clear when the column in question was written (almost three weeks ago). At the time, the upgrade problems on clones were being reported in ways very similar to mine in online forums and in places like the Boston Globe's technology section. Even a very positive review of Mac OS 8.5 in Federal Computer Week said "Several bugs have been reported ... ." The most fearful has been the hard drive �kiss of death� bug. Apparently, users with clone-based Mac OS-based systems have experienced hard-disk data loss after upgrading to Mac OS 8.5." My column suggested two ways to view these upgrade problems. One of them,

which I clearly labeled as an uncharitable view (not as a proven fact), was to see
it as an anti-clone sin or commission or omission by Apple. I certainly wasn�t
alone
in this speculation. For example, a well-known, nationally-prominent Mac columnist
(to whom I promised anonymity, so he wouldn't get flamed by the fanatics) confided
to me at the time that he thought the upgrade bugs were indeed a ploy by Apple to
create fear among users about using third-party upgrades in Macs. But since then,
the reports did top out and were not as widespread as they looked like they would
be
three weeks ago. I�m now perfectly willing to concede -- and am greatly relieved
--
that the upgrade bug was just that: a bug.

That, of course, changes nothing about Apple�s overall hostility to clones, but it
does put the upgrade problems in a very different light. And I�m very, very glad
it
does.

Unless the 68008 is something more than a 68000 with an 8bit
external bus, than it does infact have the bits that do matter:
support for an MMU as well coprocessor support superiour than
the 386 (8).

Multiprocessor mainframes have been built around 68000's.

The 68000 does have a 32bit address bus, FPU support (My old A1000 had an
FPU and a 68000 and was 100% supported by the 68000 and the OS from day
one.). An external MMU could be implemented, and often was on the old
multiprocessor servers. The overall efficiency of the 68000, not to mention
versatility still means it's a competitive processor to any 386 IMO.

Regards,

Clockmeister.

<<content snipped>>

A very interesting, cogent and highly intelligent read indeed. I greatly
appreciate the level of consciesness and the subtle touch. While indeed a

bit slanted towards Windows and such, it does give a balanced perspective towards borrowing or "stealing" ideas from eachother.

I would have placed things in a different order however. I agree with the statements on Xerox 'GUI ideas, but the read continues with Apple borrowing from Windows. Later on, it justly says that Windows first borrowed from Apple, and that it was in its later years that these roles got reversed.

I am however, very glad, that the Atarian and Amigan or Commodorian fanatics are often people who did make a "rational choice". Yes I know, we have flamers and bombers and haters among us as well, but then, doesn't any society? It is my humble experience however, that at least most Atari users are not as flamy as some of other platforms, in fact they're pretty helpful among eachother (introvert) as well as to non-Atarians (extrovert) and self-criticizing where it comes to the company that created their machines or the machines their clones are based or inspired upon.

As for Windoze people not throwing out hatemail, I guess they probably doon't really care about "opinion", being part of the mass community of Windows users, although I don't want to place this as an overall statement "about Windows users". I just realize that as long as they get what they want, they don't really care about small f(r)actions. It's all politics really.

All in all, I'm glad our Atarian world is a bit more balanced than some of the worlds that surround us or cross our paths.

Having said that, I'll turn in.

Werner Domroese / Q5

What bits are you talking about?

> support for an MMU as well coprocessor support superiour than
> the 386 (8).

The processor provides no support for this; the 68020 was the first to support F-line instructions. So tell me how 68000 copressor support is superior than that of the 80386.

> Multiprocessor mainframes have been built around 68000's.

I know, the Butterfly computer, for example, used 68000 processors. But I don't see how the point is relevant. Of course, if it is, just remember that the iPSC used 128 80286 processors

The 68000 did not have support for copressors. The manufacturer of the system had to hack them in. The 80386 provides coprocessor management instructions (just like the 68020) and a built-in MMU (just like the 68030). We can easily test your last statement; let's design a benchmark for the two processors and see which one comes out on top. We'll use an Atari and a 386-based PC. The 68000 should even have an advantage because I don't recall it having any memory wait states in Atari hardware.

Hmmmmm, when did this happen - personally, the 'Futile Shop' chain is
the one place in which never to buy anything.

The 'service' is lousy, the staff generally quite ignorant - and - or
- misleading.

On the other hand, the 'Computer City' people I have talked to here,
not only seem to know their stuff and not one of them has ever slagged
the Atari platform - in fact one individual was even quite helpful.

So if Computer City is to become another 'Futile shop' - I'll need to
find another supplier of 'goodies' !

Hello everyone!

I have the following atari Compute's books for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Compute's first book of atari games"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each
plus shipping.  I would suggest the 3 day shipping as it is only $3.00
and gets the books to you quickly at a reasonable price.  Please e-mail
me if you are interested in any of these.  Thanks!!

Douglas Carroll

Guess again, TIFKAS - I happen to see the Future Shop ads.

Guess which computer is NOT prominently featured in any of their print ads.

Also, guess which computer is NOT prominently featured in the new "Recommended Gift Catalogue" that just came out this week.....

But, guess which computer was recently featured in a review in the Toronto Star's "Fast Forward" section - and was roasted for being underpowered (he wasn't fooled by Apple's Steve Jobs Reality-Distortion Field� either) as well as its lack of a floppy drive, its dearth of software........

Also, in the recent "Computer Paper", this comment was made - that Apple would rather people think the iMac be like the new Volkswagen Beetle, while its detractors rather see it being more like an AMC Pacer (1)

Oh, yes, did you see the recent review of the iMac in Newsweek's annual computer guide? Certainly was a glowing review - NOT.

Still waiting for your take on my rebuttal to your FUD on the Hades - COWARD.

1) a car made by the late, great American Motors that was also, like the iMac, a rather neat design - and, like the iMac, noted for being underpowered. If you've seen the "Wayne's World" movie, this is the car driven by Garth (Dana Carvey) in the "Bohemian Rhapsody" scene.

You must not have seen PageMaker, Photoshop, and Director perform on a G3
like I have had compared to similar clock speeds on the wintels. Being an
Apple Power Rep on CompUSA duty affords such things and part of the arsenal.

MS Office Apps run faster on P's. Gee I wonder why..

    that's because you have yet to have sat down in front of a TOS
machine for the second time, AIRC you've stated you've used an ST a
grand total of ONCE.

    and believe me, they exist. Calamus '98, Apex Media, Smurf,
Positive Image II. Go like stink under an "underpowered" Hades with a
non-bloated operating system.

    Learn to spell "equivalent".

^^^^^^^

Hmmm, in the same article he mentions he was a former editor for
BYTE, and knows how BYTEmarks works - read the above again, weinerhead.
And he knows that Apple deliberately fudged their figures, as confirmed
by at least three independant tests from other sources, including PC
World.

Look who's trying to dodge the issue.......the same guy who can't
spell "innuendo". Must've caught a brain virus from Roger The Sad
Sheppard.....

>
>
>BS deleted below..

if only TIFKAS could only apply that same criterion to his own
posts - oh, but then they would be completely blank :)

68008 has:

8 bit data bus (68000 = 16 bit)
16 bit ALU
20 bit address bus (1 MB address limit) (68000 = 24 bit = 16MB)
32 bit data/address registers
(Sorry - I don't recall the on-chip data path width prob. 8 or 16 bit)

In essence, it was a "budget" 68000.

The 68010 (1983) could support a 68451 base/bounds MMU, but full
coprocessor support didn't arrive until the 68020 (1985)

Then make sure to clock them right. But a 386 vs a 68000 is not fair. You
should test 80386DX with 80387 versus 68030 with 68882 at the same bus and
processor clock speeds.

Well we have seen Cubase and Calamus on Wintels and on Macs, compare that to
their ORIGINAL Atari equivalents.........

Look, Mr. S., we can strike you with as many "facts" as you can strike us.
So if you in fact claim that these Photoshop etc. apps perform better on
Macs, gee I wonder why... ;-)

Probably the same reason why Cubase and Calamus run best on Ataris.
The same reason why MS-Office runs best on Intels.

And you are contradicting yourself in a very hypocritical manner. How so?
You criticize other platforms on evidence like "look on Wintels MS-Office
runs better than on the Mac" but at the same time you say "look on Macs
Photoshop runs better....

That's not a fair comparison in either way. FACTS, FACTS, FACTS, Mr.
Sinclair.

In fact he does. But facts can be interpreted and twisted in many many ways.
Apparently, you haven't read the whole posting. He clearly balanced and
backed his opinion with his knowledge of the byte tests and also stated that
Apple used ONE area of the multi-part test as "proof". Now I'd suspect that
that is not entirely factual either, although it's perfectly legal and
interpretable as such and everything, but still remains deceptive given the
nature of these tests.

Excellent, I was attacking the statement that "The overall efficiency of the 68000, not to mention versatility still means it's a competitive processor to any 386 IMO." Since we agree that this statement is false, I can move on.

     ...it depends on what you're running on it...

     If the 386 is also running GEM, then it's a fair
     comparison. Otherwise, comparing the 80386 to
     anything more than a 68000 is an unfair comparison.

>
>Excellent, I was attacking the statement that "The overall efficiency of the

     The 80386 suffers from everything else that will come with it.

Whiteline CD Bundle #5
Our fire-new CD KAPPA + CD from the Bundle a #2 of your selection (Alpha-Gamma-Delta-Omega-Psi-Substance-Complete MiNT 98 or Selected Signs) Complete package price: only 99, - DM(90$Cdn)
kappa
On kappa the CD find you among other things: 15 registered, licenced full versions: STarCall pro; Disk index; Egale; Organiser; Smurf Silver edition; Clix; PacShell; MultiStrip; TWSM/2; Music Edit light; Cairo; Face Value 2.0; Verthor; Adamas light off-lines; Resource master 2. Further: 500 fire-new Calamus Fonts; NetBSD 1.3.2; GNU C++ 2.8.1; over 3200 new types of tie-clip; new plays, data bases, hypertexts, demo, music programs, sound files, diagram programs uvm. ;altogether more than 650 MB Atari software.
Our price: 69, - DM(63$Cdn)

Whiteline CD Bundle #2
Alpha -- Gamma -- Delta -- Omega -- PSI -- Substance -- Complete MiNT 98 -- Selected Signs
2 CDs of your selection from this Bundle only 99, - DM(90$Cdn)
alpha
The classical author under the Atari CDs. On the alpha CD you find among other things: The registered full versions:
Poison! - the anti-virus program; Before Dawn - the display bildschirmschoner; Boxkite - the Fileselector and the invoicing director of customer. Further: The complete DL PD series; 200 Signum! Fonts for all printers (9/24/Laser); 500 True type Fonts for NVDI; 300 GDOS Fonts for display and printer; 500 Calamus Fonts; Programming languages and Tools; more than 100 plays (colour and mono chrome); each quantity of Tools, utilities and applications!; altogether more than 500 MB Atari software.
Our price: 59, - DM(54$Cdn)
gamma
On that you find gamma CD among other things: 8 registered full versions: Poison! - the anti-virus program!; TurnUs - the file archivist; 1stGuide - the Multitool; Rolfi - the postal zip code administration; Original - the B. Dash clone; Lazaz - packman-brightly; LDP - the character program; Easy PGP - the Cryptotool. Further: 1000 new Calamus Fonts; 1000 new True type Fonts; The complete DL PD series; Programming languages and Tools; 130 MB Falcon demos, Games & Tools; and much more besides; altogether more than 650 MB Atari software.
Our price: 59, - DM(54$Cdn)
delta
On the delta CD you find among other things: 10 registered full versions: CyPress - the text processing; Kandinsky - the vector character program; Bellini - that pixel mark program; Procurator 2 - the modular data base; Music Channel - the D-CPlayer; Printing press - the print program; MAdress - the address administration; Chaos Ult. - the Fraktalprogramm; C.A.G. - the multi-character program; Graph cousin - the picture data base. Further: 800 new Calamus Fonts; 800 new True type Fonts; Linux/68k ALD standard design; new plays, data bases, hypertexts,

demo, music programs, sound files, diagram programs uvm., altogether more than 640 MB Atari software.
Our price: 59, - DM(54$Cdn)
omega
On that you find omega CD among other things: 8 registered full versions: JAnE - the ultimate text editor; 1stGuide - the Multitool; Vesal - the versatile tutorial; Procurator 2 - the modular data base with new modules; Chronos - the date planner; GemView - the Grafiktool; Last day of the month - income - surplus - calculation program for small to middle enterprises; Director of customer + - the professional version of the good invoicing with stock management and info. post office. Further: The complete DL PD series (188disk) freshly updates (with very many updates); the complete GNU C++ 2.7.2; type of tie-clip purifies 3000; 500 Internet diagrams; extensive Internet and on-line file; Linux/68k ALD standard design; Povray 3,0 complete file; more than 50 new plays Multimedia; totally (animations, sounds and visions) and much more besides altogether more than 600 MB Atari software.
Our price: 59, - DM(54$Cdn)
psi
On the psi CD you find among other things:11 registered full versions: Stella 2 - the document data base for the administration, manipulation and display of any data; GemView 3 - the outstanding View and conversion program for pictures of all kinds; Kandinsky 2,5 - the reference of the vector character programs; F-copy per - the copying and archiving program of the superlative; Thing - the first-class and Desktopalternative up-to-date; GeoCAD - geographical map design of the finest one; Play it again, IN ACCORDANCE WITH! - the GEM Spielepaket with4 different plays; Almost second gate Backup - the Backupprogramm for all Atari computers; DaCapo - the extensive address administration with serial letter function; GEM Installer for Linux/68k - for very easy Linux installation on push of a button; TurnUs - the ingenious file archivist. Further: 500 fire-new, high-quality Calamus Fonts (with umlauts); Linux/68k ALD complete version; NetBSD 1.2.1; more than 50 new plays; more than 200 MB Tools, utilities, applications, sound, diagrams etc.and much more besides altogether more than 630 MB Atari software.
Our price: 69, - DM(63$Cdn)
substance
The Substance CD contains the following public domain series in packed form: GFA BASIC club series(191 diskettes) Delta lab DL series(193 diskettes) ST vision series(484 diskettes) Atari journal J series(335 diskettes) Atari journal TT series(9 diskettes) Atari magazine series(116 diskettes) Contrast 7000er series(50 diskettes) PD pool 2000er series(330 diskettes) HSN sound files series(53 diskettes) Calamus Font series (87 diskettes) altogether approximately 600 MB Atari software in ZIP files, inclusive file BBS files for the application in mailboxes and the descriptions of all programs.
Our price: 59, - DM(54$Cdn)
complete mint ' 98
On these CD are all at present available MiNT�Tools! complete X11; LANGUAGES: PERL, HUGE, TCL, GNU C++ 2.7.2; Complete MiNTOS; MiNTNET; All Internet Tools: Gopher, WWW, ftp, telnet etc.; All MiNT distribution kit; Further the complete MiNT course from the D-CMagazine is contained of revolution.

Our price: 59, - DM(54$Cdn)
selected signs
High-quality Fonts in all usual formats finds you on our Selected Signs�CD.
Among other things all CFN�Fonts of all Whiteline�CDs, everything ever appear-ends GDOS Fonts and a rich selection of beautiful True type Fonts, which transmits also with NVDI. In addition Fontutilities and Bearbeitungstools u.v.m.
In points of pass: more than 3000 Calamus Fonts (very many unpublished); more than 1400 True type Fonts; more than 600 GDOS Fonts; many Font Tools and utilities!
Our price: 49, - DM(45$Cdn)

Whiteline CD Bundle #3
Linux/68k complete package: 4 CDs with Linux/68k 2,0 + updates 2,2 + SOURCES + Resources
Complete package price: only 129, - DM(107$Cdn)
linux/68k 2.0
On these CD find you the complete Linux/68k with the Kernel 2.0x version for Atari, Mac and Amiga. In addition a multiplicity of efficient programs, the graphic user surface X11 and those KDE - beta 3 Unix Desktop version. Many diagram programs, Games, sound programs, Matheprogramme, text processings and wordprocessors, Internetbrowser and Tools, and much more besides.
Our price: 79, - DM(72$Cdn) In the Bundle with the Linux/68k Sourcen CD only 99, - DM(90$Cdn) (instead of 118, - DM)
linux/68k 2,2 updates
On these CD find you that Update 2,2 the Linux/68k 2,0 CD.Additionally all current versions on the Linux/68k 2,0 CD available application programs. This CD is only in connection with the originals Whiteline Linux/68k 2.0 CD usable.
Our price: 39, - DM(36$Cdn)
linux/68k 2,0 sourcen
On these CD find you all Sourcen to that Linux/68k 2,0 CD.
Our price: 39, - DM(36$Cdn) In the Bundle with the Linux/68k 2,0 CD only 20, - DM (18$Cdn)
linux/68k 2,0 resources
Many useful Tools, utilities and programs for Linux/68k 2,0 the inclusive pertinent Sourcen. (no overlaps with the Linux/68k 2,0 Sourcen CD!)
Our price: 49, - DM(45$Cdn)

Whiteline CD Bundle #1
Propaganda -- Erotica -- all about Signum! -- transmission -- MacAlpha -- Atari Forever of volume of 1
3 CDs of your selection from this Bundle only 69, - DM (63$Cdn)
propaganda
Here everything turns around hypertexts. A number of giants of these attractive info texts to all only conceivable areas of the knowledge. Fast look-up and access functions distinguish this system. Naturally also the newest versions of ST Guide and 1st Guide.

Our price: 29, - DM(27$Cdn)
all about signum!
Everything which one for the daily use of the legendary text processing for ATARI computer is necessary on these CD. 600 Signum!2 Fonts for all printers 100 brand-new Signum!3 Fonts for all printers Tools & utilities for Signum!
Our price: 49, - DM(45$Cdn)
transmission
On the transmission CD for the Atari Falcon030 you find among other things: 2 registered full versions: (all Falcon only!) Golden Iceland - the popular strategy play. More turbo-brightly - the display bildschirmschoner. Further: the demos of the Fried bits 1.2 and 3 Coder party; each quantity of Falcon Games; almost all otherwise appeared; Falcon demo! ; Music and diagram programs, Tools, document, sound, pictures, animations u.v.m. altogether more than 500 MB Atari Falcon software.
Our price: 29, - DM(27$Cdn)

From Don who uses PC's and Macs daily...Thats real world testing..Not Mr. Langa who'm does not use a G3 which translates into no factual credibility not to mention PC World and PC Magazine who have a lot to lose..

"The Rev B iMac"

Fresh Crabb, 12/7/1998

Crabb�s Bottom Line Power Macintosh iMac, Re.v B The Goods: Faster and cheaper than the first iMac Rating: 9.5 Vendor: Apple Platforms: Mac OS URL: http://www.apple.com Phone:408-996-1010 List Price: $1,299, as low as $1,199 street

In Short: ""You want an inexpensive, fast, plug and play home PC?

This one's it.""

Apple Computer, riding the wave of popularity set by its innovative and inexpensiveiMac home computer has given potential iMac buyers a gift for Christmas -- iMac,revision B. The new iMac,which still lists for $1,299,can be had for at little as $1,199 at some stores, and can also be purchased via the new Apple Loan program for a mere $29.99 per month -- a real gift for those of us on a budget.

The revised iMac still sports a 233MHz G3 PowerPC processor, making it more than twice as fast as the fastest Pentium machine in its price class (the 233MHz Pentium II), and close to the speed as the fastest 450MHz Pentium II that lives in $2,500 Windowsworkstations. The revised iMac finally gives a realvoice to Apple's ThinkDifferent ad campaign.

The revised iMac also looks different than its Pentium Wintel competition, because it is different. Besides its alternately funky and snazzy translucent white and teal plastic case, contoured Euro-look mouse and keyboard, and built-in handle (remember the original Mac?), the iMac is jammed with technology that belies its price.

Consider its fast 233MHz G3 CPU with 512KB of backsid eL2 cache that easily beats theWintel competition.

Consider its two 12Mbps Universal Serial Bus expansion ports, 32MB of SDRAM,expandable to 160MB, 4GB EIDEhard disk drive, and 24XCD-ROM drive -- all equalling or beating the Wintel competition, plus its 56Kbps modem for fast Internet connections, hence the name,iMac. The machine runs on a 66MHz system bus (fast for a Mac), which also adds to its speed.

Consider its 4Mbps infrared (IrDA) port for quickconnections to digital cameras, printers, or wirelessnetwork hubs. Or its built-in SRS surround sound stereospeakers flanking its high-res 15 inch color monitor (1024 by768 pixels), plus built-in fast 10/100BASE-T Ethernet networking jack. And don't forget a software bundle offering Quicken 98 Deluxe,Internet Explorer 4.0 Plus,AOL 4.0, AppleWorks (formerlycalled ClarisWorks), and a nice bunch of utilities,games, and eduware including Kai's Photo Soap, Kai's PowerGoo, and Disney's Animated Storybook.

The revision B iMac also ups its video RAM complement to 6MB working in an ATI RAGE Pro 3D card which really juices graphics and 3D gaming performance. To further speed things up and improve reliability the iMac B now comes with Mac OS 8.5 -- which is much more reliable and a tick or two faster than the Mac OS 8.1 that shipped on the first iMacs.

The new iMac still lacks a floppy disk drive, although you can buy a third partydrive from Imation for $149the reads and and writes regular 1.44MB floppies, plus 120MB SuperDisks.

The iMac also lacks any expansion slots, since it's made to be a what-you-buy-is-what-you- get machine. And unlike other Macs, the revised iMac does not offer a Small Computer System Interface (SCSI), for connecting to any existing SCSI external devices you might own, although you can buy an adapter (the Microtech Express USB for $79) that lets you plug your SCSI devices into your iMac's USB ports.

Although Apple only started selling the original iMac in August, universities got interested in the machine as a required or suggested back-to-school computer for their students very early. Dartmouth College of Hanover, NH, for example, recommendedthe iMac for its entering Class of 2002 as the ""preferred computer forincoming students.""

The College believes this system represents the best choice formost students, after having weighed such factors as cost, performance, and projections for long-term utility in the Dartmouth environment. The recommended package has enough computing power to be useful in Dartmouth�s present � and future � computingenvironment. ""It is well suited to the electronic mail, wordprocessing, information access, and graphics tasks that dominate Dartmouth student use of a personal computer,"" said Dartmouth in awelcome packet to its freshman class.

The revised iMac performed very well in my tests, providing, as promised, a one-click connection to the Internet. Setup took about as long as removing it from thebox, plugging in the powercord, keyboard, mouse, and modem. Compared to Compaq Presario, Gateway, and HP Windows-based family PCs priced nearly identically, the iMac was a breeze to setup and use for the first time.

With its newly improved video performance, lower price, low price loan program, and core value, the iMac from Apple remains a Crabb's Best Buy.

That's interesting. How does linux run on a 68000? It runs quite nicely on a
386. Same with QNX. Or is GEM the most important part of any software system?

> The 80386 suffers from everything else that will come with it.

What comes with it? Are you talking hardware or software?

I disagree. I would scale things like this:

286
68000
68010
68020 and 386
68030
486SX
68LC040
486DX
68040
486DX2
68040 double clock variety
Pentium
Pentium MMX
Pentium Pro
68060
Celeron
K6
Pentium II

Based on CPU specs themselves where bitness outweighs features such as MMX or an MMU.

I partially agree. A 386SX vs. a 68000 clocked at the same rates CAN come
very close. Ofcourse, that would mean comparing a 68000 @ 16MHz to a 386SX

(yes the SX is important in this) @ 16MHz.

And the results of that comparison heavily depend on the importance of various factors, such as either bus efficiency or use of an MMU. It really depends what is more important.

So, yes, from the technical point of view, we agree. But that doesn't mean an inferior processor or an inferior system in terms of processing power, can not be competitive. (Yes I know, you didn't say that, but I just wanted to make sure we're on the same wavelength).

Linux is not a fair comparison either. As we all know, it REQUIRES an MMU,
which is built into the 386 internally and higher, as well as in the 68030
(subset of 68851) and higher (supersets of the 68851). The 68020 can have
one 68851 added externally.

So that would be the basic system. You could compare Minix though....

Yes it does. BUT, erm does this have anything to do with the issues at hand here? If you'd like we could discuss other issues as well.

:-)

     Doing anything serious with QNX will require considerably
     more resources than GEM will. Even that spiffy QNX demodisk
     runs into certain limitations (like not booting some PCs).

     Depending on how heavily core is being used, the MMU
     may or may not be an issue. People are still trying
     to find something generally useful to do with MMX so
     the lack of it is hardly a reason to knock a micro-
     processor.

     Certainly, for the kinds of uses that WinVocates and
     MacVocates like to state for their pedestrian userbases
     an MMU is certainly overrated.

We have that kind of sales expertise over here, too :-). Nice to know
it's international!

> This is further reinforced by the fact that Future Shop
> is often very unknowledgeable about PC's too.

So, referring to the title of this post, they used to know nothing about
the PC; now they also don't know anything about the Macs?

Markku

Look Dumbs*it....It's my business to know the real facts involved when

```
comparing the features as well as performance between G3's and Pentiums.
It's a fact that apps like Photoshop, PageMaker, Director and so on perform
as much as twice the speed of the same Pentium clock speed.  Even the PC
staff admitt that the G3's excell in performance.

It's also true that MS has enginnered Office 97 to perform better than Office
98 on the Mac.

>     but then again, he works around people at InCompUSA.....

well, one thing you could do, Milo, is to vist the Application Systems Heidelberg site again using Alta Vista's Babelfish function to translate (I must admit, it works quite well......).

You can also visit http://bengy.atari.org, or http://www.telusplanet.net/public/bengy/MINDEX.HTM - this is Bengy Collins' MagiC Support Page which explains all about the different versions of MagiC, including MagiCMac (an Atari-compatible operating system for 68030/040, PowerPC and G3 Macs) and MagiCPC (an Atari emulator program for Windows '95). Bengy also keeps a demo of MagiCMac on his pages, so you can try it out and see what you think.

<snip pseudo-proof of why PCs are superior to the Hades, a machine he has never seen or used>

hmmm, where do we begin:

1) posted a private letter from Edward Baiz onto a public forum without his permission - considered poor nettiquette (of course, par for the course for TIFKAS, who thinks USENET is his own public toilet)

2) 300MhZ PCs are still available. But even 400-450mHz PCs are crippled when running buggy operating systems like Windows '9x, whereas the sleek operating systems found on the Hades whizzes right by - including the overpriced, underpowered iMac. Remember too that TIFKAS has proven time and again that he can never be considered an expert on TOS hardware and architecture, to the point that he has to fabricate facts out of smoke and mirrors......(gee, TIFKAS must be running out of arguments when he has to hold up a WINTEL system to try to discredit Hades users - guess he can't use one of his expensive G3 towers to hold it up as a yardstick)

3) Cost factor - well, you can cut the cost factor right down when you buy the motherboard kit from the dealer and add your own parts to PC prices - and it's worth it.. Of course, TIFKAS will whine that it's all "hack n' slash", but then mummy must have told him never to touch a motherboard as there might be icky germs that might get inside him the next time he picks his nose......

4) He picked the wrong guy to try to argue with and smear- as you can see, Edward actually OWNS a Hades, and knows it inside out and what it does. Anyone who tries to wheedle a negative turn out of a GLOWING POSITIVE RESPONSE for his choice of computer must be in dire need of a vacation (or else he hasn't had his two o'clock slapping). I predict Edward will reply to this, and I shudder to think what will happen to TIFKAS when he's faced with someone with actual facts instead of Steve

Jobs Reality-Distortion Field� - inspired FUD.....

5) TIFKAS loses further points because his choice of "newsreader", DejaNews, has totally smushed the letter to the point that it's painful (and pointless) to try and read his fanciful spin on the facts. Surely one who has bragged loud and long about how Netscape Communicator and IE4 are "superior Internet Applications" could try to spend a few minutes to set up their internal USENET capability. Oh, sorry - we're talking about TIFKAS, the loser troll who can be easily outwitted by a jar of Vegemite!

BTW, TIFKAS - I notice you still haven't responded to MY rebuttal of your pathetic attack on the Hades. Chicken? (and BTW, I sent e-mail to the guy you gave the FUD to with the real facts on the Hades - you're not going to like what he told me what he thinks of you and you disinformation campaigns, but then I keep much of my e-mail correpondance private, and always ask permission.....)

Hmm, I now predict that TIFKAS will post another lame flame to his imaginary friend "Chunks"......

A comparable PC (from a processor standpoint) would be an 286. A 386 is
decisively better than a 68000. I bet that you could get a 386 for around
$50. I can't remember what kind of video, sound and memory you'd find in a
386 but, compared to an ST, it would probably be fairly good. Of course,
you'd loose the MIDI connectors. I'm actually looking for a 386 class machine
to act as a mail and low-volume web server so if someone knows more about
pricing, please contact me.

From a processor standpoint yes. But also bare in mind that 386's have poor
busefficiency compared to Intel thingies. I think I said something about
where to

place the 68000, I still think between 286 and 386. But you're right. IBM
PC/AT
was around 1986 I think, just after the first 68000's. And a 68030 machine
is not
that cheap compared to 386, except perhaps some older Macs.
I think the 68020 more likely resembles a 386, and the 68030 between a 386DX
and a 486SX. BTW - A 68000 / 010 could in theory be compared to a 386SX.
The latter you can buy for $50, I agree. But decisively beter heavily
depends on the OS and apps you're using. Sure as application server or file
server under an older O.S.
it's fine. Even current O.S.'s run altough you'll need quite some expensive
30-pin SIMM memory to run them smoothly. :-)

I'm a network administrator so I think I have at least some knowledge in
this area :-)

The 060 processors number crunching performance is comparable to that of a Pentium 75 roughly. Ofcourse, with a reasonably efficient operating system (unlike Windows) the computer may feel a great deal faster, certainly more responsive. But when serious number crunching is called for (rendering for example) the processing performance of the 060 doesn't cut it with todays, even yesterdays Pentium chips.

Remember too that TIFKAS

> has proven time and again that he can never be considered an expert on

The G3 is a fine processor. MacOS is the dog.

> 3) Cost factor - well, you can cut the cost factor right down when

This is assuming that the fellow has used current Pentiums or G3 Macs before.
A port of Quake should really tell of the relative performance to a PC, MAC or even AmigaQuake 060.

> 5) TIFKAS loses further points because his choice of "newsreader", DejaNews, has totally smushed the letter to the point that it's painful (and pointless) to try and read his fanciful spin on the facts. Oh, sorry - we're talking about TIFKAS, the loser troll who can be easily outwitted by a jar of Vegemite!

Netscape is quite good really, although IE4 is total monopolistic,
disfunctional bloatware.

> BTW, TIFKAS - I notice you still haven't responded to MY rebuttal of your pathetic attack on the Hades. Chicken? (and BTW, I sent e-mail to the guy you gave the FUD to with the real facts on the Hades - you're not going to like what he told me what he thinks of you and you disinformation campaigns, but then I keep much of my e-mail correpondance private, and always ask permission.....)
>

Anyone using MacOS and then attacking other OS's is lame. MacOS is a dog,
and TIFKAS knows it.

Regards,

Clockmeister.

Roughly...

68000 = 386SX
68010 = 386SX
68020 = 386DX
68030 = 486DX
68040 = 486DX2/4
68060 = P75

From experience, that would seem about right but with the cleaner OS's (Atari/Amiga) and custom chips the Motorola based systems often perform much better then this list may suggest.

Most 386's didn't come with a soundcard at all, that was mostly the 486 era.
Video was often VGA 640x480 x 16/256 colours and possibly 800x600x16 colours.

I'm talking most common 386's here, there where exceptions.

A 386DX40's are probably the only usefull 386's I've come across IMO.

Regards,

Clockmeister.
